Safety Precautions

The PowerCommand Network can be used to remotely operate power transfer equipment (e.g., transfer switches, paralleling systems) and start and stop generator sets. All of the safety precautions for that equipment must be observed. Refer to the Operator's Manual for the equipment that is being monitored and controlled by the network for important safety precautions.

The following symbols, found throughout this manual, alert you to potentially dangerous conditions to the operator, service personnel, or the equipment.

DANGER *This symbol warns of immediate hazards which will result in severe personal injury or death.*

WARNING *This symbol refers to a hazard or unsafe practice which can result in severe personal injury or death.*

CAUTION *This symbol refers to a hazard or unsafe practice which can result in personal injury or product or property damage.*

MOVING PARTS CAN CAUSE SEVERE PERSONAL INJURY OR DEATH

- Keep your hands, clothing, and jewelry away from moving parts.
- Before starting work on the generator set, disconnect battery charger from its AC source, then disconnect starting batteries, negative (-) cable first. This will prevent accidental starting.

- Make sure that fasteners on the generator set are secure. Tighten supports and clamps, keep guards in position over fans, drive belts, etc.
- Do not wear loose clothing or jewelry in the vicinity of moving parts, or while working on electrical equipment. Loose clothing and jewelry can become caught in moving parts. Jewelry can short out electrical contacts and cause shock or burning.
- If adjustment must be made while the unit is running, use extreme caution around hot manifolds, moving parts, etc.

ELECTRICAL SHOCK CAN CAUSE SEVERE PERSONAL INJURY OR DEATH

- Remove electric power before removing protective shields or touching electrical equipment. Use rubber insulative mats placed on dry wood platforms over floors that are metal or concrete when around electrical equipment. Do not wear damp clothing (particularly wet shoes) or allow skin surface to be damp when handling electrical equipment.
- Use extreme caution when working on electrical components. High voltages can cause injury or death. DO NOT tamper with interlocks.
- Follow all applicable state and local electrical codes. Have all electrical installations performed by a qualified licensed electrician. Tag and lock open switches to avoid accidental closure.
- Jewelry is a good conductor of electricity and should be removed before working on electrical equipment.

MEDIUM VOLTAGE GENERATOR SETS (601V to 15kV)

- Medium voltage acts differently than low voltage. Special equipment and training is required to work on or around medium voltage equipment. Operation and maintenance must be done only by persons trained and qualified to work on such devices. Improper use or procedures will result in severe personal injury or death.
- Do not work on energized equipment. Unauthorized personnel must not be permitted near energized equipment. Due to the nature of medium voltage electrical equipment, induced voltage can remain even after the equipment is disconnected from the power source. Plan the time for maintenance with authorized personnel so that the equipment can be de-energized and safely grounded.

TRANSFER SWITCHES

- AC and DC voltages in the transfer switch components present serious shock hazards that can result in severe personal injury or death. Read and follow these instructions.
- Keep the transfer switch cabinet closed and locked. Make sure only authorized personnel have cabinet and operational keys.
- Due to the serious shock hazard from medium voltages within the cabinet, all service and adjustments to the transfer switch must be performed only by an electrician or authorized service representative.

- If the cabinet must be opened for any reason:
 1. Move the operation selector switch on the generator set to Stop.
 2. Disconnect battery charger from its AC source. Disconnect the starting batteries of the generator set. (Remove the negative [-] lead first to prevent arcing from igniting explosive battery gas.)
 3. Remove AC power to the automatic transfer switch. If the instructions require otherwise, use extreme caution due to the danger of shock hazard.

GENERAL SAFETY PRECAUTIONS

- The PowerCommand Network allows remote operation of equipment. PowerCommand Software for Windows can remotely start and stop a genset or exercise a transfer switch. Network modules can independently control other network modules and operate other electrical devices such as fans or pumps etc. Make certain that all appropriate personnel are notified before remotely operating equipment and make them aware of any equipment that can be energized automatically.
- Do not work on this equipment when mentally or physically fatigued, or after consuming any alcohol or drug that makes the operation of equipment unsafe.
- Use only the latest physical and logical connection diagrams for installing and maintaining the PowerCommand Network. If changes are made to the physical or logical network connections, make sure the site connection diagrams are updated. Create a new CSV file if the number or type of modules changes or if the bindings change.

1. Introduction

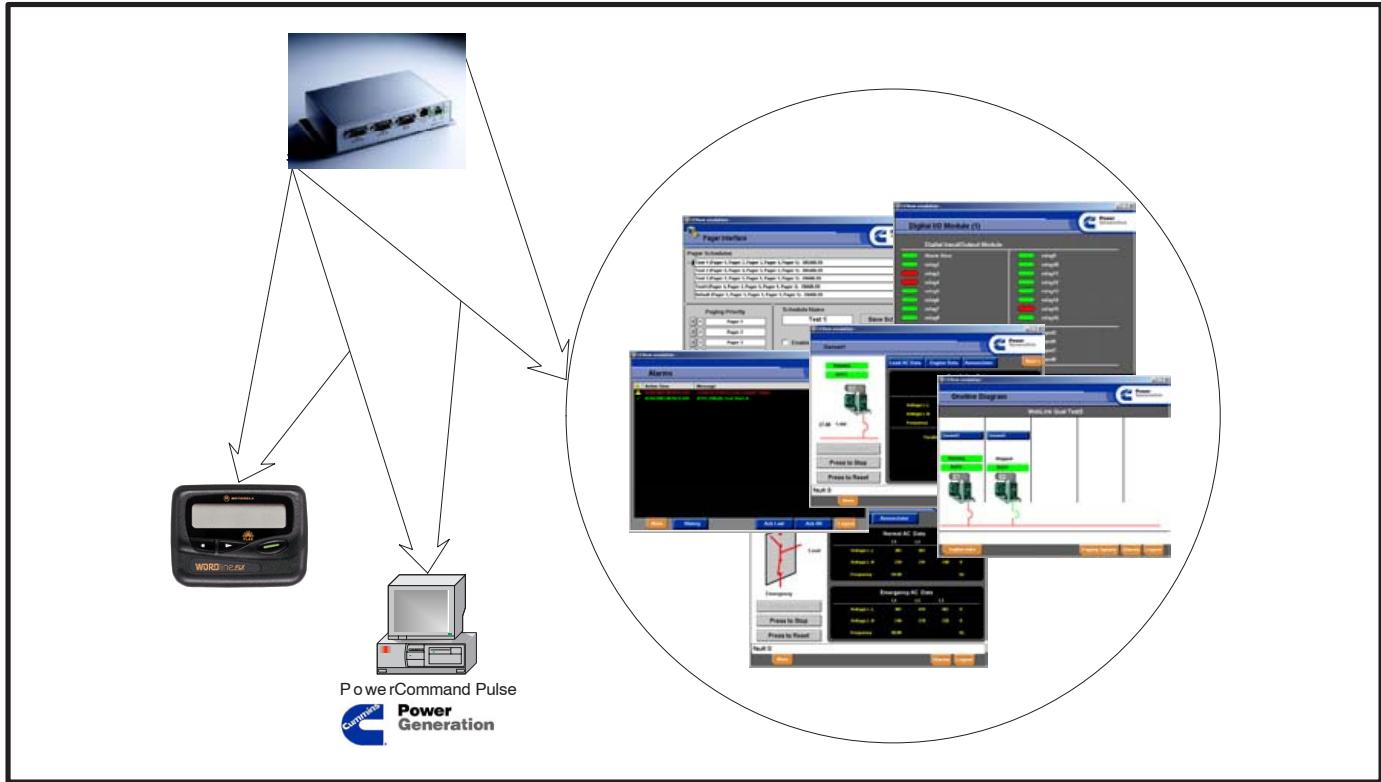

FIGURE 1-1. THE REMOTE NETWORK MONITORING SYSTEM

WELCOME

The PowerCommand iWatch™ is a Windows CE based device that provides monitoring and control of generators and/or transfer switches via the Cummins PowerCommand FT-10 (Echelon LonWorks) network. Access to PowerCommand iWatch can be obtained either over an Ethernet LAN/WAN or by using Internet Explorer version 5.5 or higher.

The Cummins Power Generation Remote Network Monitoring (RNM) software is a suite of components that provide an easy-to-use system for the monitoring of remote generator sites.

The suite is composed of three major components.

- The PowerCommand iWatch Application – Used by the operator to monitor and control Generator, Transfer Switch, and Digital I/O Module (DIM) information and alarms.
- The Configuration Tool

- The OPC Multiplexor

The RNM system works with a Lonworks FT-10 network to communicate with all types of PowerCommand controls (PCC 3100, 3200, 2100, 1301, etc).

The following is included in this manual:

- Section 2 describes the Configuration Tool, which is a point and click mechanism to define PowerCommand iWatch applications for remote sites. If your system has been configured by the factory, this section can be skipped.
- Section 3 describes the OPC Multiplexor, which is an OPC 2.0 DA compliant server for on-demand connected remote PowerCommand iWatch devices. This OPC server has been optimized to integrate with the Cummins Power Generation, PowerCommand Pulse, Genesis Ionics software package.
- Appendix A provides information on register mapping of modules to a ModLon Gateway.

WHO SHOULD USE THIS MANUAL?

This manual is designed to be used by system integrators and distributors.

Before using this manual, a network must be properly set up (see FT-10 Network Installation and Operation Manual 900-0529) and the PowerCommand iWatch control assembly must be installed (see Instruction Sheet C661). To install and configure an PowerCommand iWatch control, personnel must be trained and experienced in setting up FT-10 networks and familiar with LonMaker for Windows software.

WRITING CONVENTIONS

The following conventions are used in writing this manual:

- **Boldface** type indicates an item that requires specific attention. This is used for note blocks as shown in next column.

NOTE: This is an example of a note block. Special attention should be given to the instructions in this form.

- ***Bold Italic*** type indicates an item to select. This is used to direct user interface interaction steps as follows:

Once you have selected a file or entered a **File Name**, press the **Open** button to open the file (see Figure 1-2).

- Monospace type indicates text you will need to type in a data entry field. In the previous example, **File Name** is a data entry field.

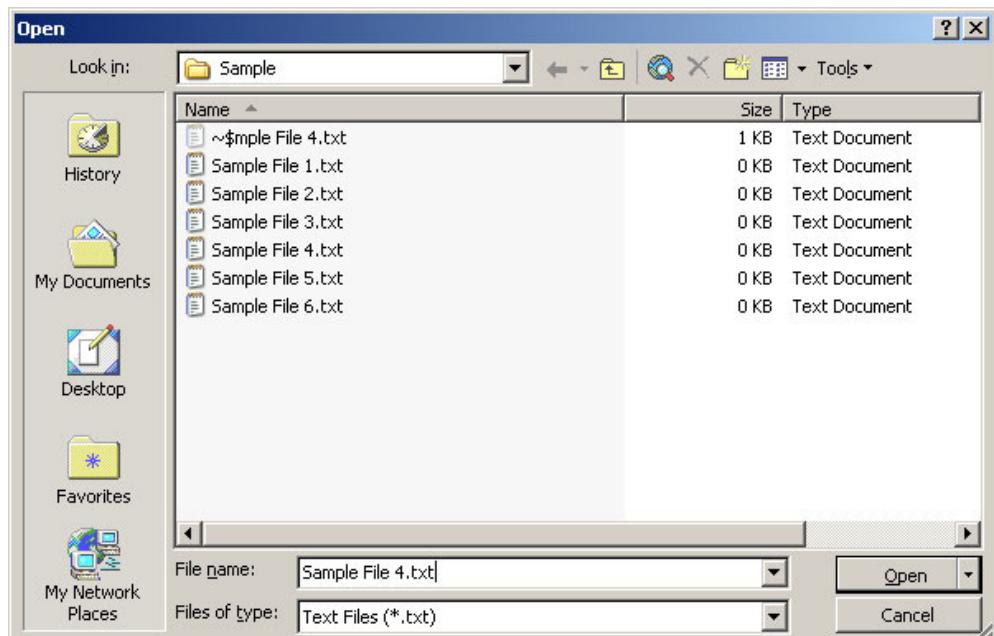

FIGURE 1-2. OPEN DIALOG

2. Configuration Tool

INTRODUCTION

The Configuration Tool is a stand alone application that is used to configure the list of devices and types that are associated with remote generator sites. The site configuration can then be used to generate Advantech Studio WebLink® applications. This greatly reduces the effort by a system integration engineer in creating a unique site configuration to match a specific site's devices.

NOTE: For systems configured by the factory, this section can be skipped.

Individual parameters of the site application and device tags can be customized prior to creating the ap-

plication to download to the device. The site options that are configurable are:

- Name
- IP Address
- Remote Access Server (RAS) Login Security
- Units of Measure
- Paging System Repeat Frequency
- Storing and Forwarding Alarm and Historical Data

The device tag level options available are:

- Digital I/O Module (DIM) input and relay naming
- Historical Logging
- Alarming

INSTALLATION

NOTE: The Advantech Studio 6.0 software package must be installed prior to installing the Configuration Tool. Refer to the Advantech Studio installation guide for more information on performing this step.

The installation of the Configuration tool is performed using the Setup.exe on the distribution CD. This application prompts the user for the option to install the Configuration Tool only or both the configuration tool and the OPC Multiplexor.

The first two dialogs that appear are shown in Figures 2-1 and 2-2.

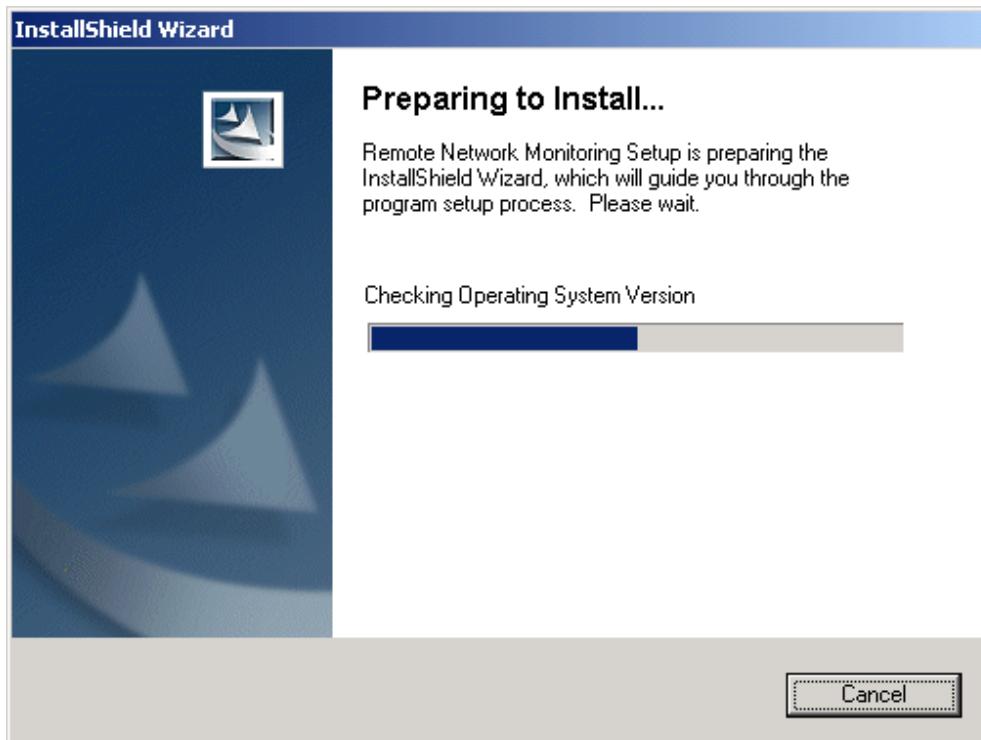

FIGURE 2-1. INITIAL INSTALLATION DIALOG

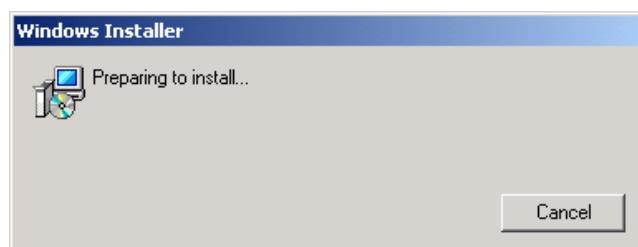

FIGURE 2-2. SECOND INSTALLATION DIALOG

Once the pre-installation process is complete, the main dialog window is displayed (see Figure 2-3). Press the *Next* button to continue or the *Cancel* button to exit the installation.

The next dialog prompts you to review and either accept or reject the license agreement (see Figure

2-4). You should select the radio button for *I accept the terms in the license agreement* to continue. Select the *Next* button to continue the installation process. If you do not accept the license agreement the installation will abort. You may select the *Back* button to return to the previous dialog.

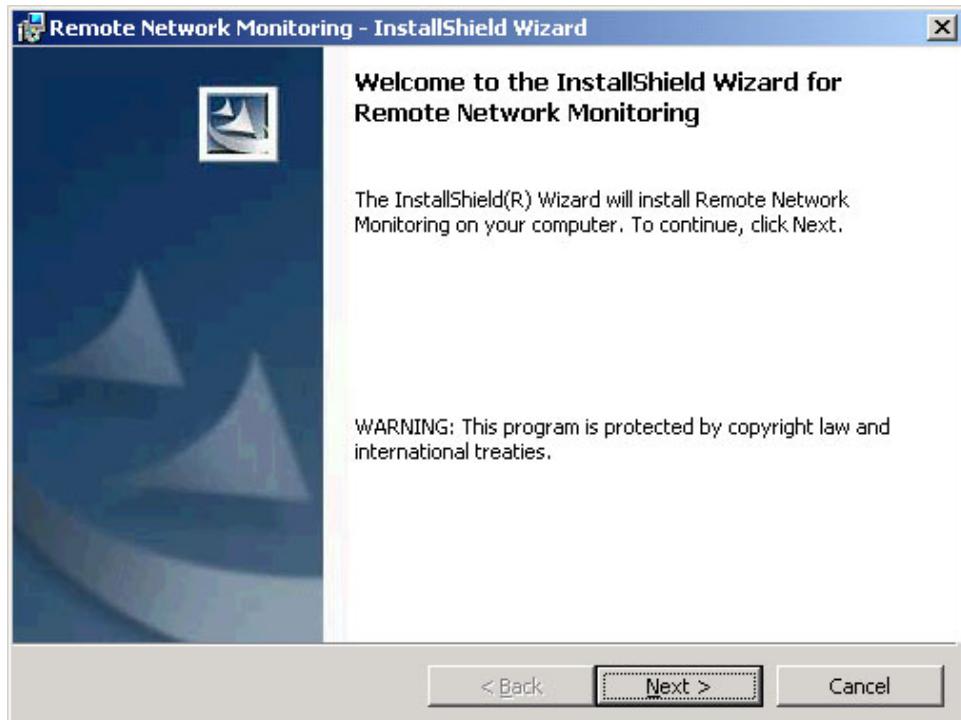

FIGURE 2-3. MAIN INSTALLATION DIALOG

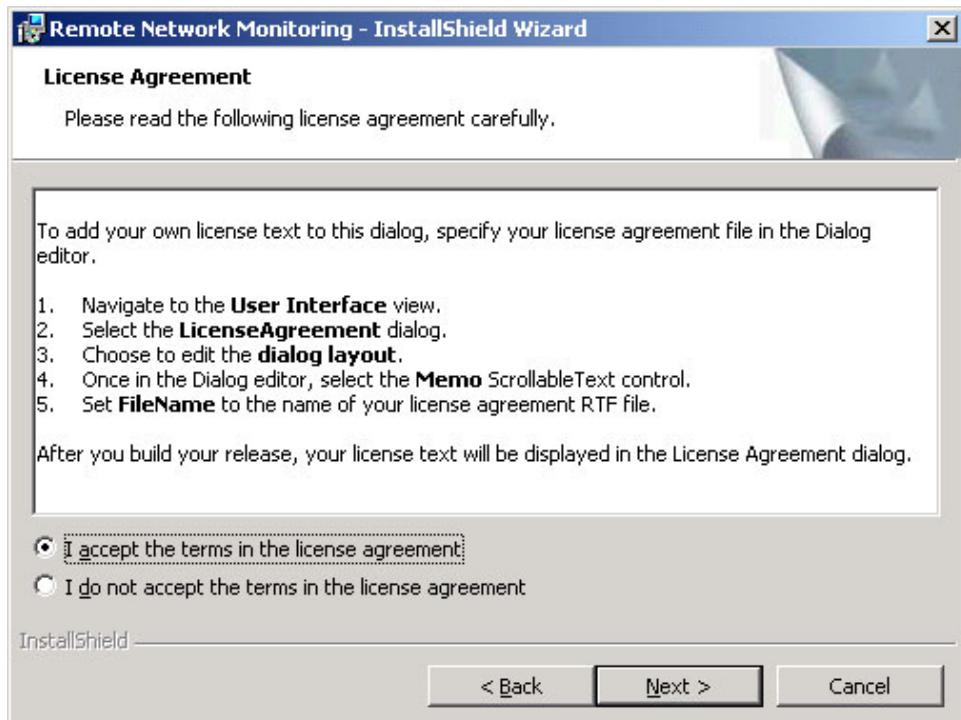

FIGURE 2-4. LICENSE AGREEMENT

The next dialog prompts you to enter your name and organization information (see Figure 2-5). The option to install this application only for the logged-in user or all users of the computer is available. Press the *Next* button to continue.

The next dialog prompts you for a Complete or Custom installation (see Figure 2-6). Select the *Next* button to continue the installation process.

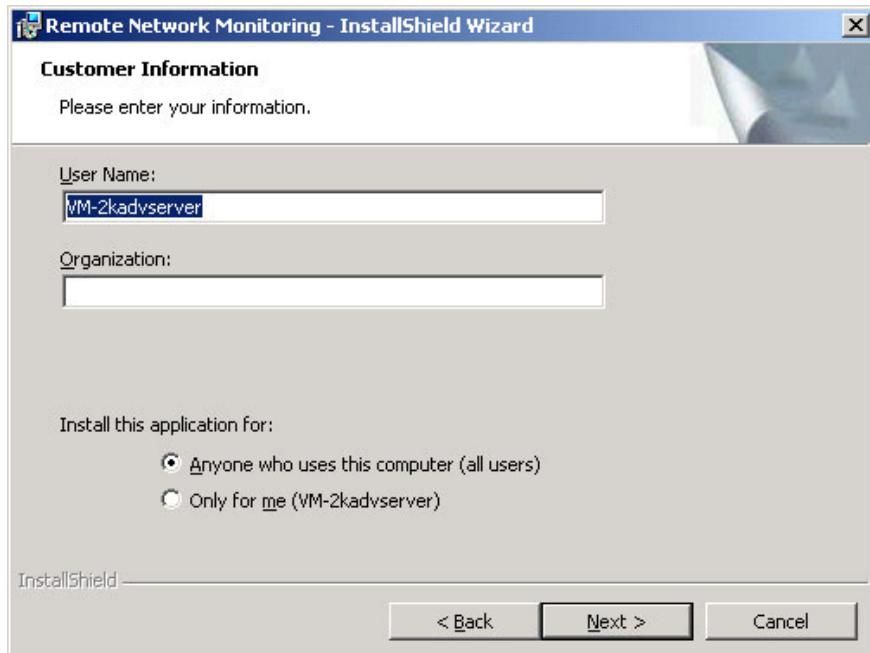

FIGURE 2-5. INSTALLATION INFORMATION

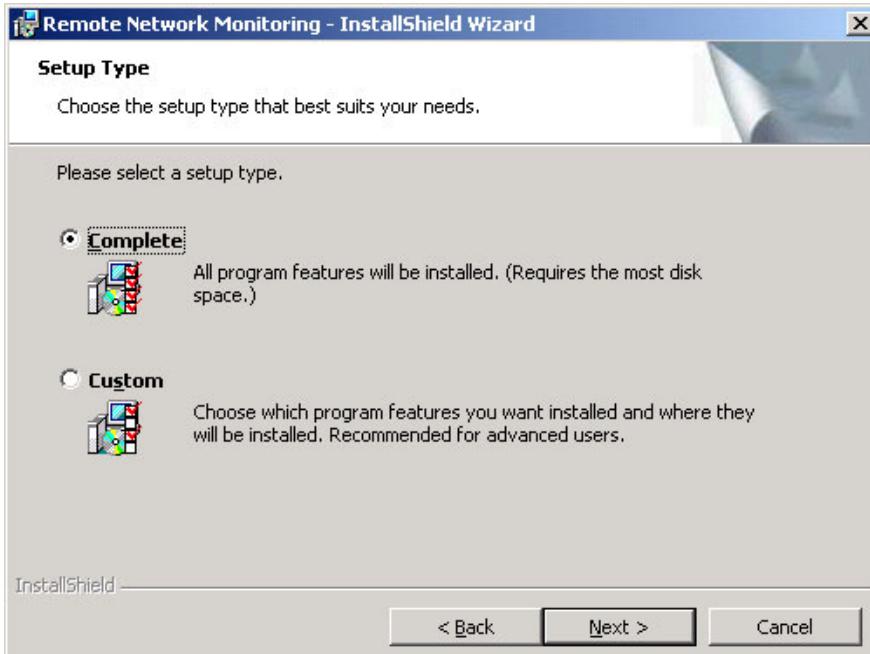

FIGURE 2-6. INSTALLATION CUSTOMIZATION OPTION

If the Custom option is selected, a list of installation options is displayed with all items selected (see Figure 2-7). If you wish to not install an option, click on the option and the choice to not install that option is displayed.

The installation path of the application can be changed by selecting the *Change* button. A file browser dialog is displayed for selecting an alternate location for the install.

Information about the amount of disk space required for installing each component is displayed when the *Space* button is selected.

Select the *Next* button to continue the installation.

Prior to the installation proceeding, a final opportunity to go *Back* and change the options is presented (see Figure 2-8). If no changes are required, select the *Install* button to continue the installation.

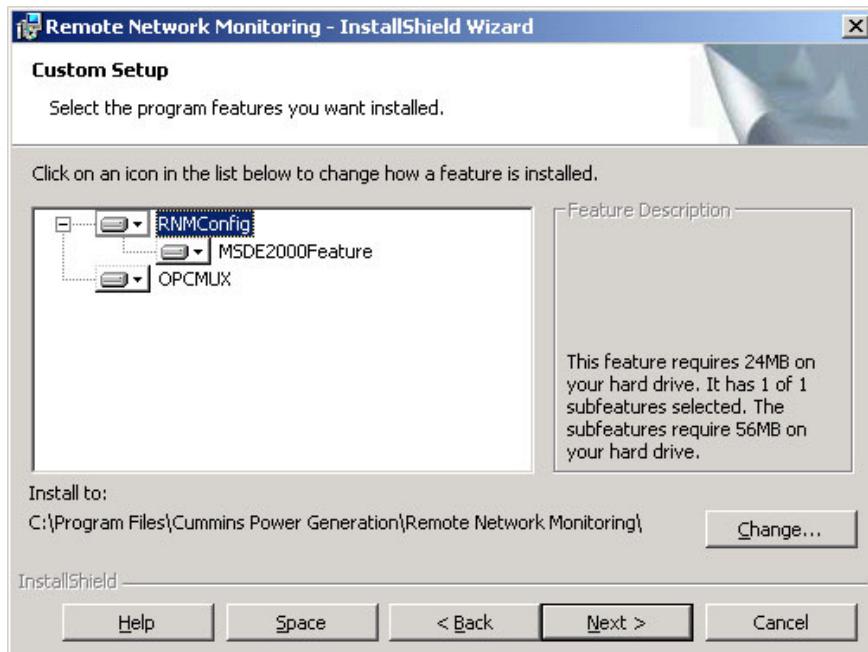

FIGURE 2-7. INSTALLATION CUSTOMIZATION

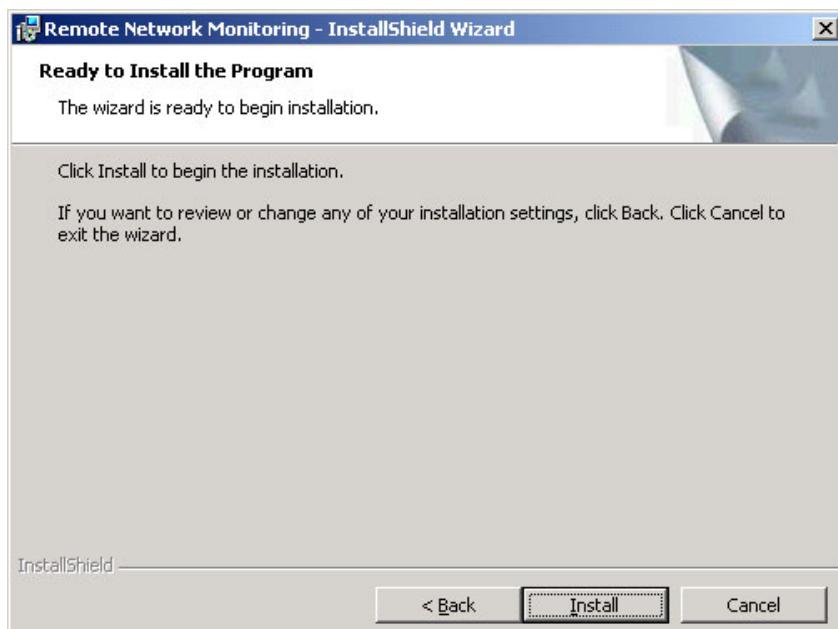

FIGURE 2-8. FINAL INSTALLATION CHECKPOINT

The installation will proceed at this point. The installation takes several minutes and a series of dialogs like the one shown in Figure 2-9 are displayed.

When the installation complete dialog is displayed, the installation is completed. Select the *Finish* button.

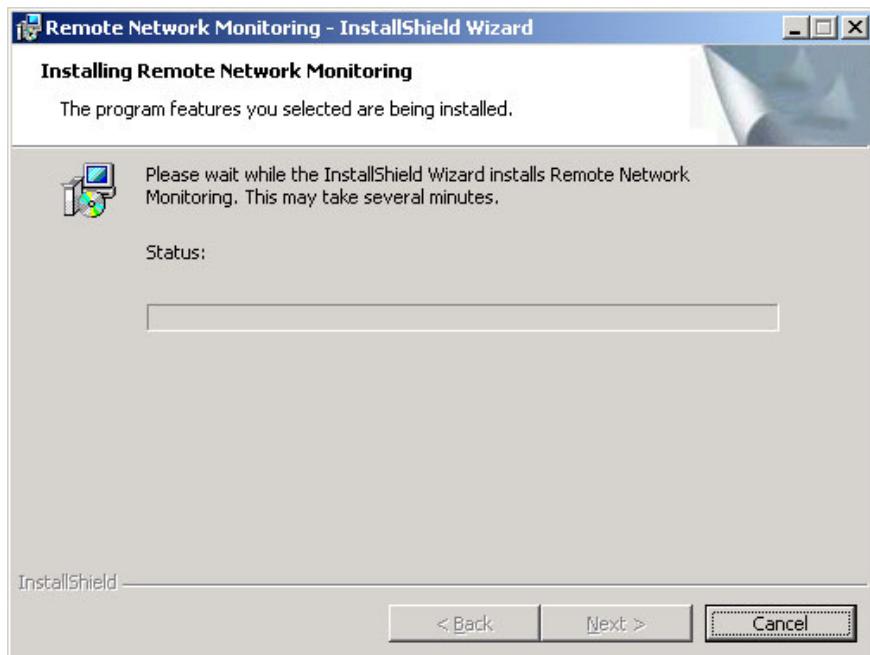

FIGURE 2-9. INSTALLATION PROGRESS

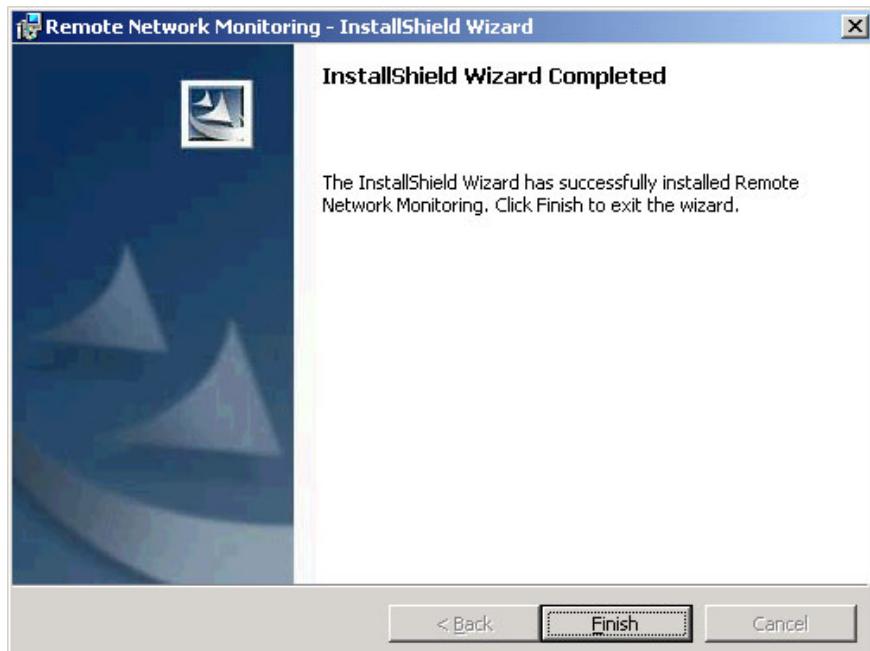

FIGURE 2-10. INSTALLATION COMPLETE!

The system then notifies you that a reboot of the system is required to continue (see Figure 2-11). If you choose not to reboot the system now, the applications will not run properly.

After the reboot is completed, the configuration tool can be run to initialize the configuration database. It is available either through the desktop icon or in the Program Start Menu (see Figure 2-12).

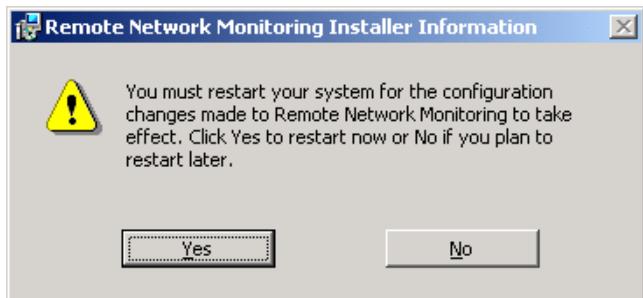

FIGURE 2-11. REBOOT SYSTEM DIALOG

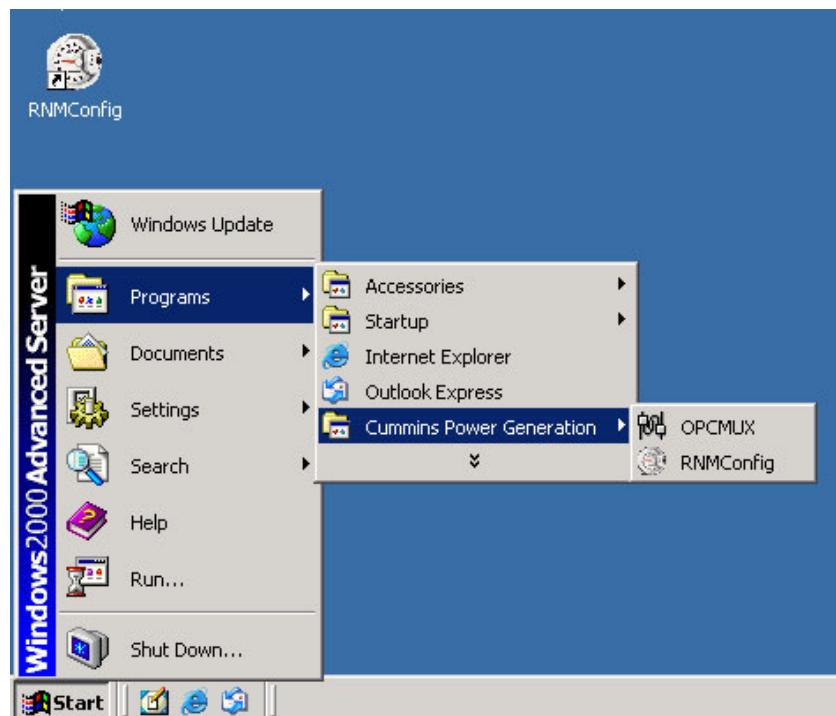

FIGURE 2-12. LAUNCHING RNMCONFIG

APPLICATION OVERVIEW

The configuration tool main screen is displayed upon launching the program (see Figure 2-13). This user interface is the central point for managing the list of sites and their configured ModLon gateways and devices.

The Site Configurations section on the left side of

the screen displays the explorer-like tree view of the configured sites, ModLon gateways, and devices. The Configuration section on the right side of the screen displays the individual set of information for a selected site, ModLon gateway, device, or tag.

A new site can be added by selecting and right clicking on the Site Configurations label (see Figure 2-14).

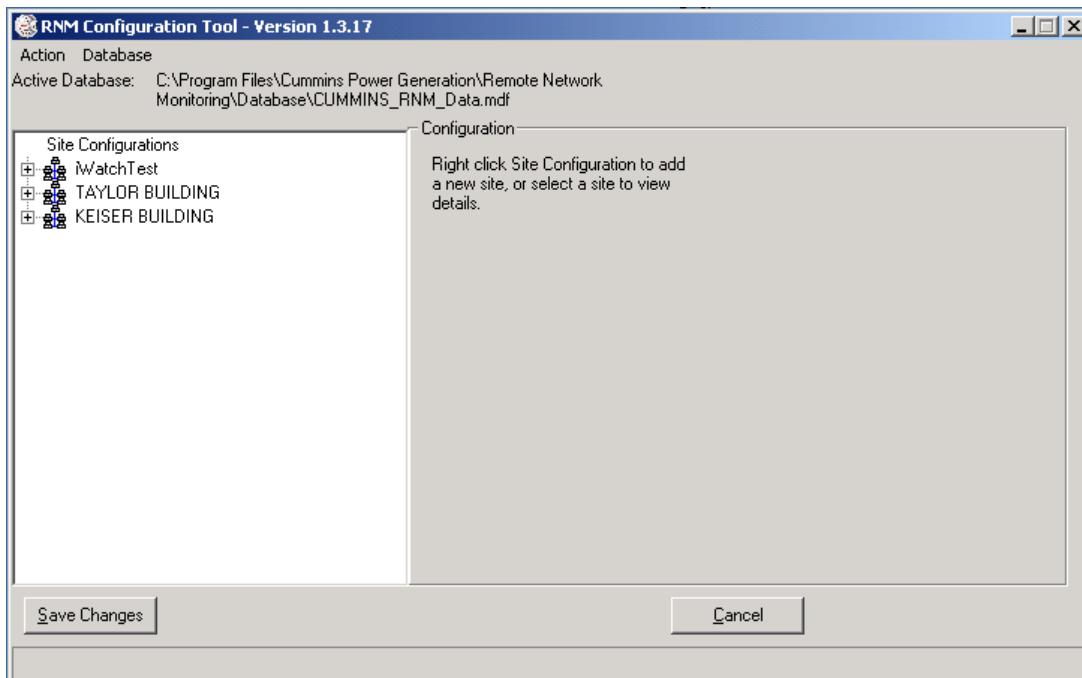

FIGURE 2-13. CONFIGURATION TOOL USER INTERFACE

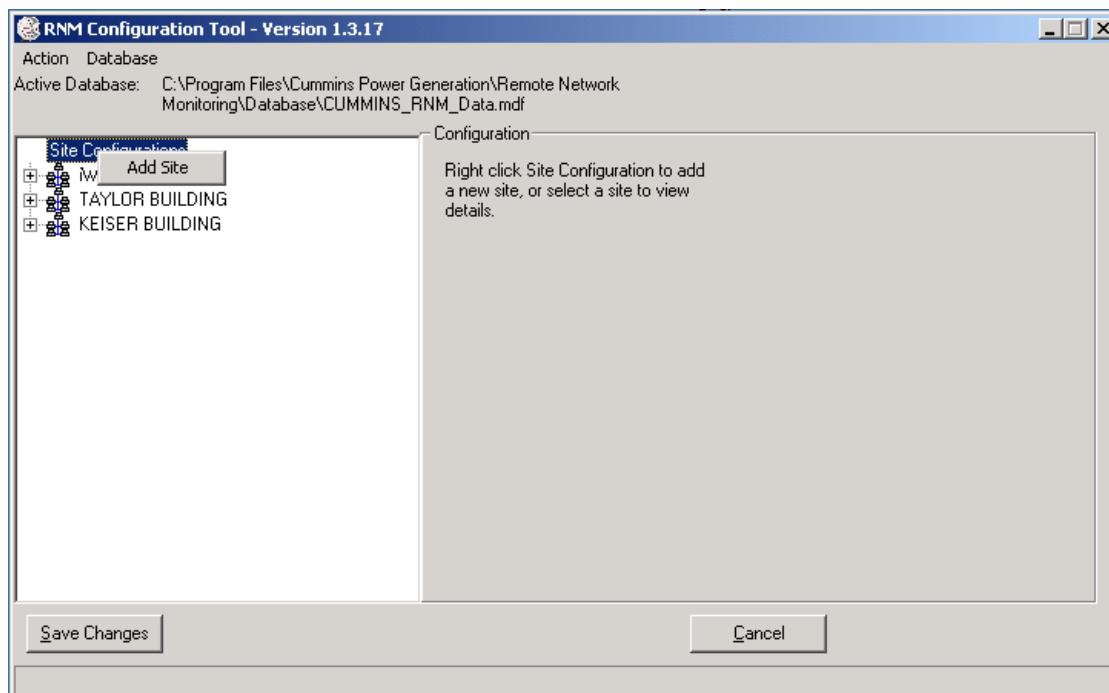

FIGURE 2-14. ADDING A SITE

SITE CONFIGURATION

“Add Site” is displayed when you right click on the Site Configurations label. When you click this, the Site Information configuration dialog is displayed (see Figure 2-15). This is the same dialog that is displayed when you edit a site after it has been configured. The only difference is that the current information for the configured site is filled into the dialog fields.

Base information for the site to be configured must be entered. If you wish to close this window without entering any site information, press the *Cancel* button.

The field descriptions listed in Table 2-1 describe the data that may be entered into this dialog.

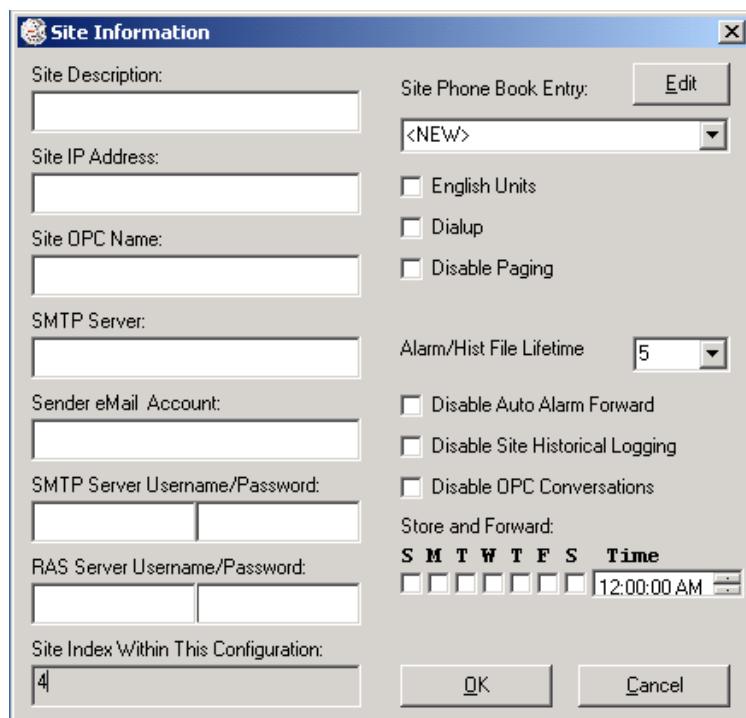

FIGURE 2-15. SITE INFORMATION DIALOG

TABLE 2-1. SITE CONFIGURATION FIELD DEFINITIONS

Field	Description	Default Value
Site Description	This is the long description of a site name. The Site OPC Name holds the shorter version of the site name.	Blank
Site IP Address	This is the dot notation site IP address in the form ###.###.###.###	Blank
Site OPC Name	This is the short site description used in the first portion of the OPC item name.	Site# – which is incremented for each added site
SMTP Server	This field identifies the SMTP Server	Blank
Sender eMail Account	This field is the name of the eMail Account holder	Blank
SMTP Server Username	This is the user name for the SMTP server	Blank
SMTP Server Password	This is the password for the SMTP server	Blank
RAS Server Username	This is the user name for the RAS security for a dial-up WebLink	Blank
RAS Server Password	This is the password for the RAS security for a dial-up WebLink	Blank
Site Phone Book Entry*	This is the combo selection box for previously configured host RAS entries. The New button allows to create a new host RAS entry	<NEW>
English Units	This field allows for the selection of English units of measure. If unchecked the device will display metric units of measure.	Unchecked – Metric
Dialup	This field allows for the marking of a site as dial-up connectivity. If unchecked the device IP Address will be assumed to be on local Ethernet network.	Unchecked – Ethernet
Disable Paging	This field allows for disabling the alarm based paging system in a configured Advantech Studio application.	Unchecked – Paging Enabled
Alarm/Hist File Lifetime	This field allows the selection of the length of time to keep historical files prior to automatically overwriting.	5 days
Disable Auto Alarm Forward	This field allows for the disabling of site automatic alarm forwarding to the host system	Unchecked – Auto Alarm forwarding Enabled
Disable Site Historical Logging	This field allows for the disabling of site historical data logging.	Unchecked – Historical Logging Enabled
Disable OPC Conversations	This field allows disabling of OPC conversations between the site and the host.	Unchecked – OPC Conversations Enabled
Store and Forward Days of Week	This field allows for the selection of which days of the week that retrieval of remote stored information is performed	All Unchecked – Forward on host demand only
Store and Forward Time	This field allows for the selection of time of day that the retrieval of remote stored information is performed	12:00:00 AM

* If the option for Site Phone Book Entry is set to <NEW> and the **Edit** button is selected, the operating system dialogs for configuring an RAS entry are displayed. Select the **OK** button when the site configuration is complete.

Once a site has been added, selecting the *Save Changes* button saves the site configuration information in the database (see Figure 2-16).

ModLon gateways can now be added to a site.

The *Edit Site* or *Add Modlon* options are displayed when you right mouse click on a site name (see Figure 2-17). The Site Information dialog described above is displayed when *Edit Site* is selected. The ModLon Gateway dialog is displayed if the *Add Modlon* option is selected (see page 2-14).

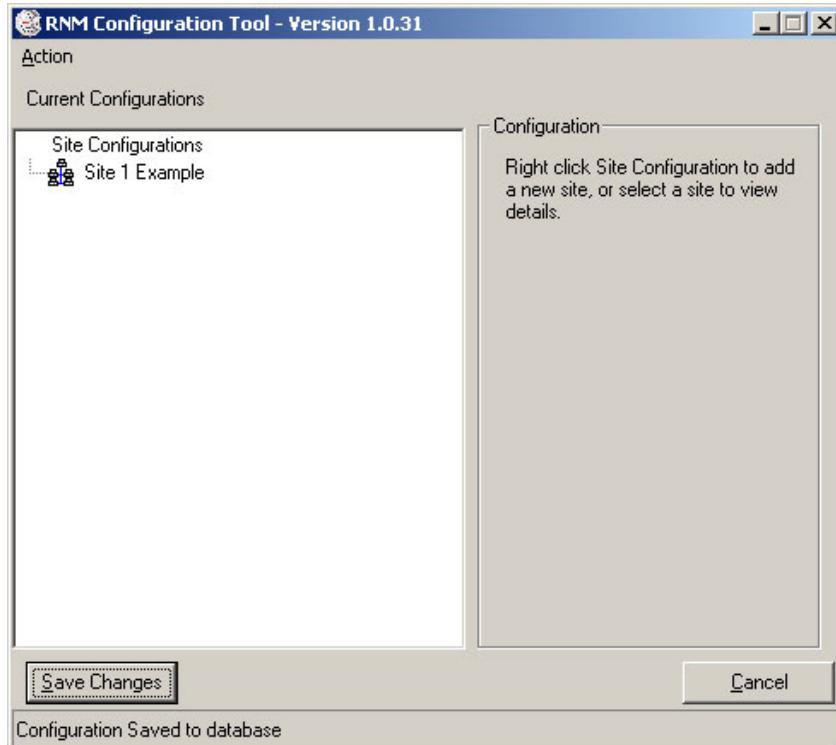

FIGURE 2-16. SAVE CHANGES

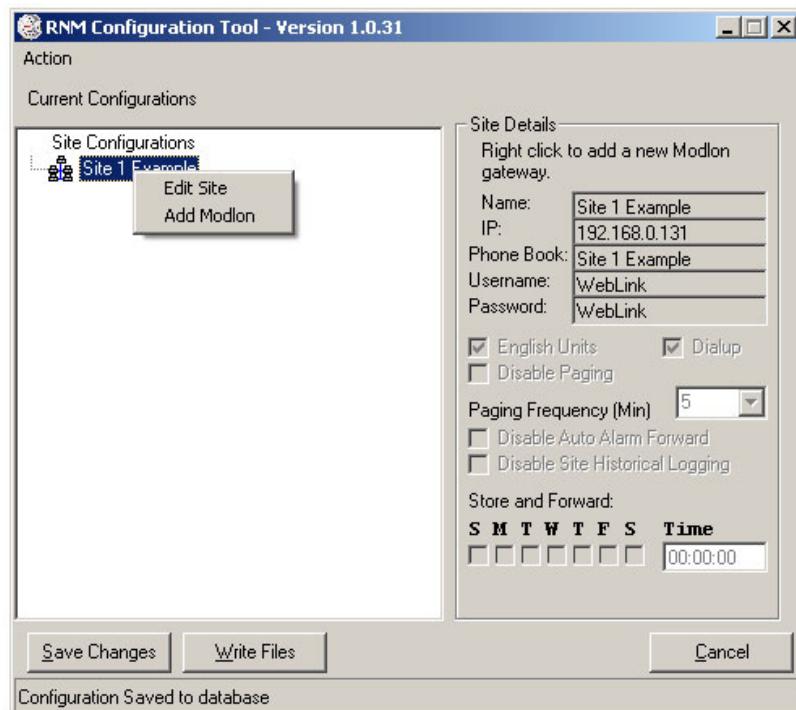

FIGURE 2-17. RIGHT MOUSE CLICK ON SITE

RAS ENTRY CONFIGURATION

The series of dialogs displayed by the operating system to configure an RAS dial-out entry are described below.

The default selection of *Dial-up to private network* is used for dial-up connections (see Figure 2-18). Select the *Next* button to view the next dialog.

NOTE: If you wish to use another type of RAS connection other than dial-up, refer to your operating system user's guide for more information on configuring Virtual Private Network (VPN), direct connect, and broadband connection types.

Enter in the phone number of the site where the remote WebLink is located (see Figure 2-19). Select the *Next* button to continue.

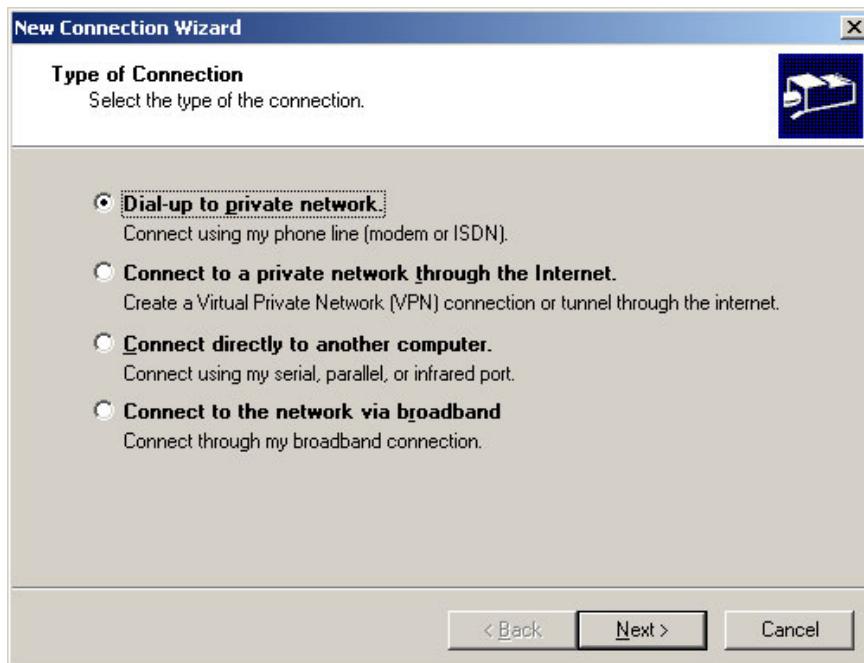

FIGURE 2-18. RAS CONFIGURATION – TYPE OF CONNECTION

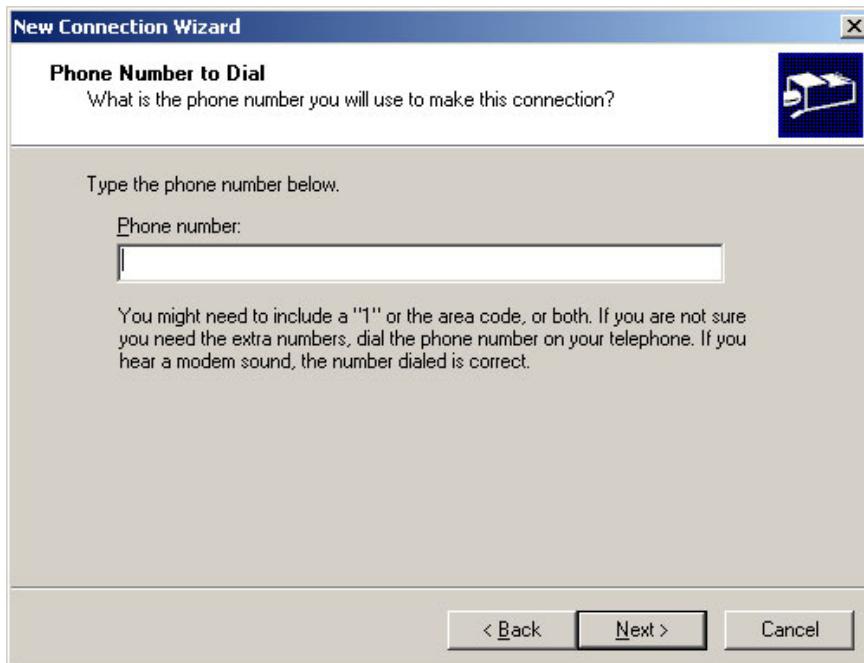

FIGURE 2-19. RAS CONFIGURATION – PHONE NUMBER

Enter in the name of the RAS phone book entry you are creating (see Figure 2-20). Press the *Finish* button to continue.

The dialog shown in Figure 2-21 allows for custo-

mization of the RAS phone book setting for security and networking. No changes are required for a default site configuration; the WebLink provides its own IP address. Press the *OK* button to continue.

FIGURE 2-20. RAS CONFIGURATION – PHONE NUMBER

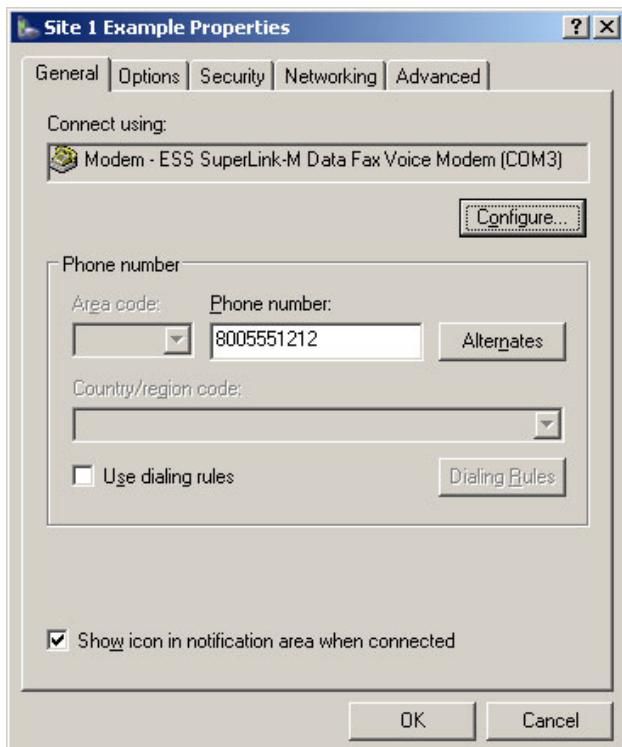

FIGURE 2-21. RAS CONFIGURATION – RAS ENTRY PROPERTIES

MODLON GATEWAY CONFIGURATION

The ModLon Gateway information dialog allows for naming a ModLon gateway and selecting its type (see Figure 2-22).

The *Description* field is the long description of a ModLon gateway and the *OPC Name* is the short

description used in the OPC item name. The default values for the *Description* and *OPC Name* fields are ModLon#, with # incrementing for each ModLon gateway within a selected site.

The available options when the *Modlon Gateway Configuration Option* is pulled down are as shown in Figure 2-23.

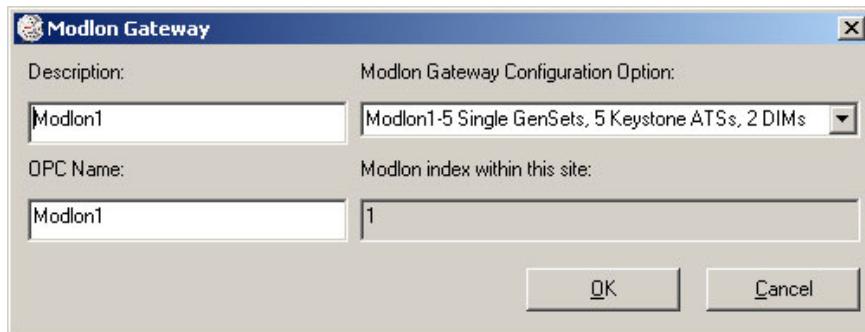

FIGURE 2-22. MODLON GATEWAY CONFIGURATION

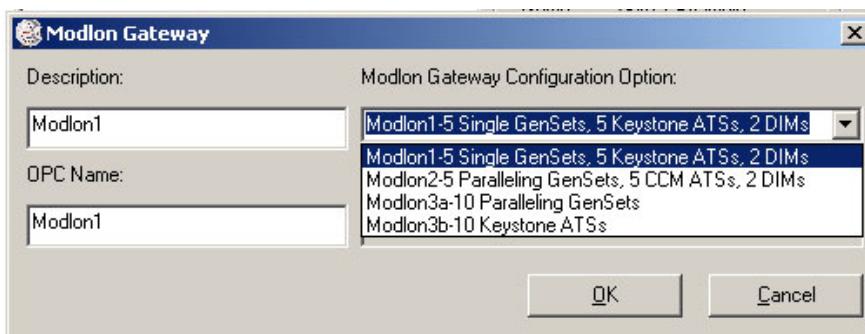

FIGURE 2-23. MODLON GATEWAY – CONFIGURATION OPTIONS

Press the **OK** button to continue. Figure 2-24 shows the resulting main Configuration Tool screen after a ModLon has been added to a site. ModLon settings are shown on the right side.

When you right mouse click on a ModLon entry, the pop-up dialog shown in Figure 2-25 is displayed.

This allows for adding devices to a ModLon gateway.

NOTE: Once a ModLon gateway has been added to a site and saved, it cannot be edited because the device types available to a ModLon gateway are fixed. This prevents the mismatching of device types to ModLon gateway types.

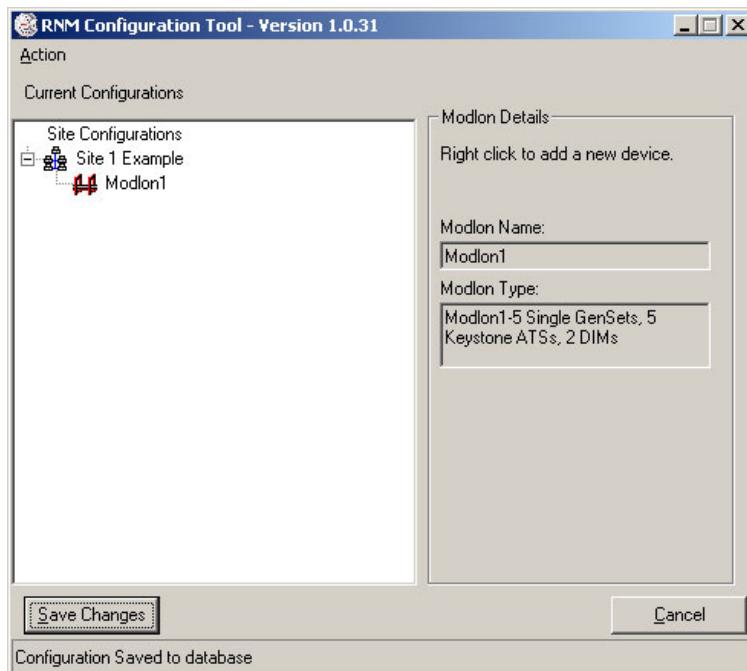

FIGURE 2-24. MODLON DETAILS

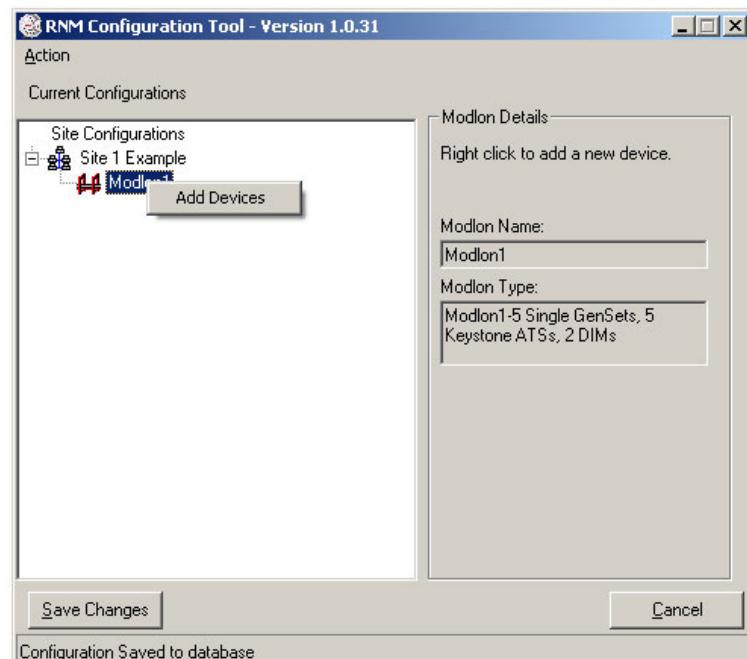

FIGURE 2-25. MODLON ENTRY RIGHT MOUSE CLICK

DEVICE CONFIGURATION

The device configuration dialog presents a list of available devices. The list is dependent upon the type of ModLon gateway that the device is being added to (see Figure 2-26).

Once a device is selected from the *Available Device Types*, the *Device Description* and *Device OPC Name* fields are automatically filled in (see Figure 2-27).

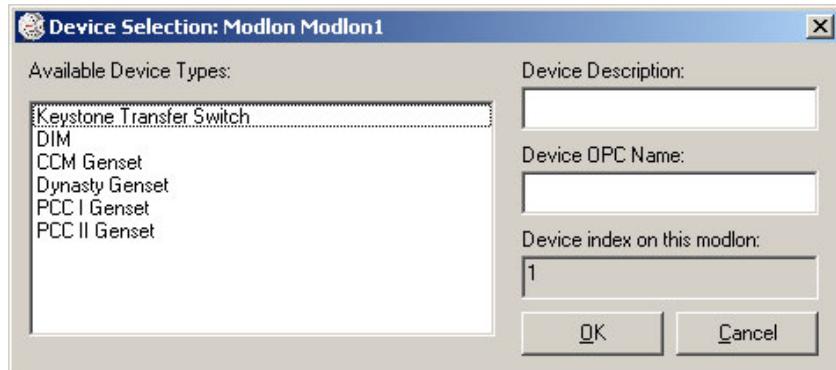

FIGURE 2-26. DEVICE SELECTION

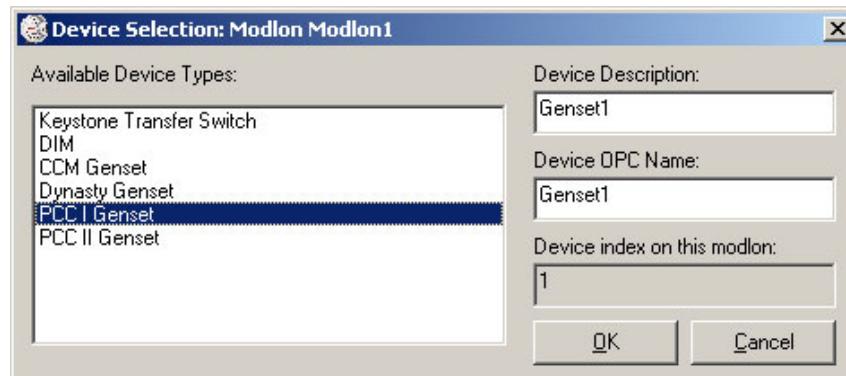

FIGURE 2-27. DEVICE SELECTION DEFAULT VALUES

The default values for the *Device Description* and *Device OPC Name* fields are [DEVICE]#, where [DEVICE] is either Genset, ATS, or DIM and # is incremented for each new device added to a ModLon gateway. Select *OK* to add the device to a ModLon gateway.

Figure 2-28 shows the resulting main Configuration Tool screen after a device has been added to a

ModLon gateway. The right portion of the dialog shows device settings.

The folders beneath the device name are preset, based on device type. Click on the + symbol next to a device folder to view individual tags for the device (see Figure 2-29).

When an individual tag is selected the following dialog is displayed to modify the settings for that tag.

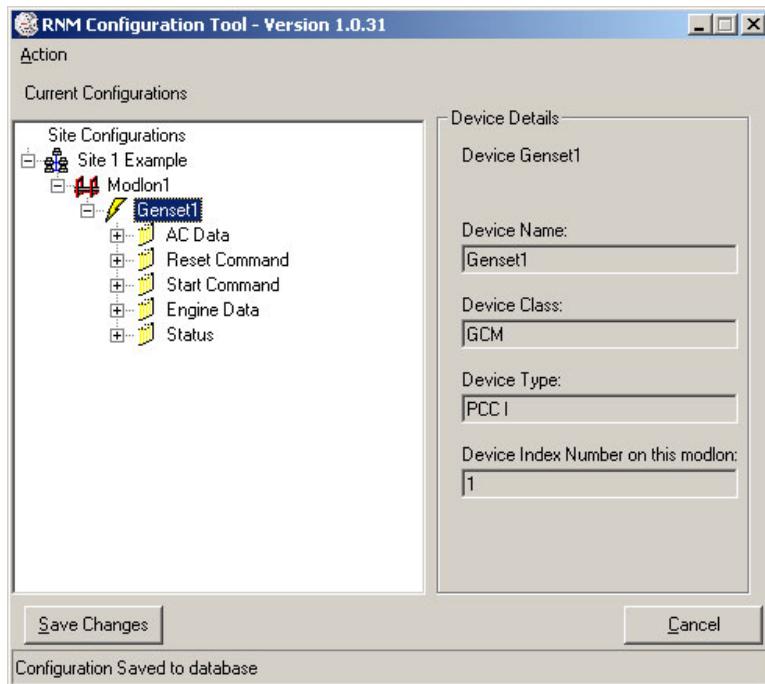

FIGURE 2-28. DEVICE DETAILS

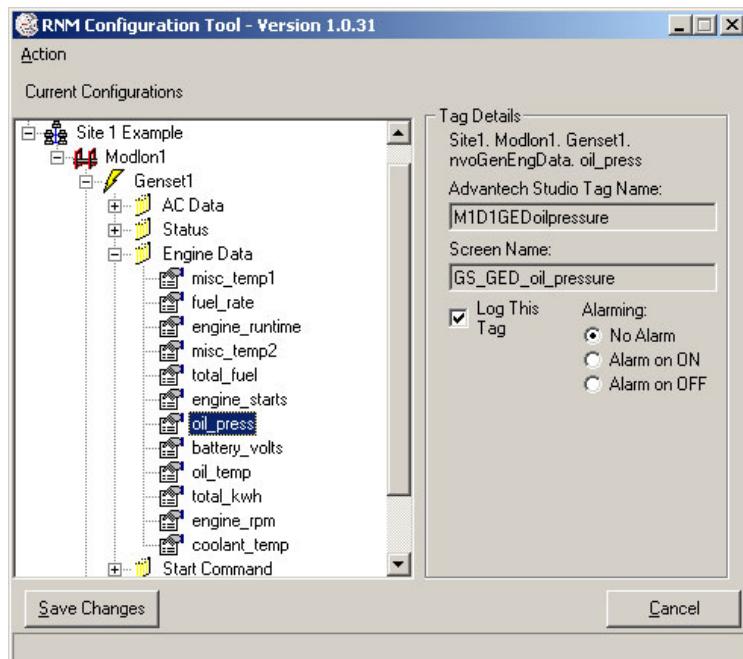

FIGURE 2-29. TAG DETAILS

The options available to edit a tag are *Log This Tag*, *Trend This Tag*, and *Alarming* (see Figure 2-30). Default values are associated with these fields and are editable for each tag within a device.

If the tag selected is an input or relay of a Digital I/O module, the ability to assign custom names to these tags is allowed for both the description display in the Advantech Studio WebLink application and the OPC item name.

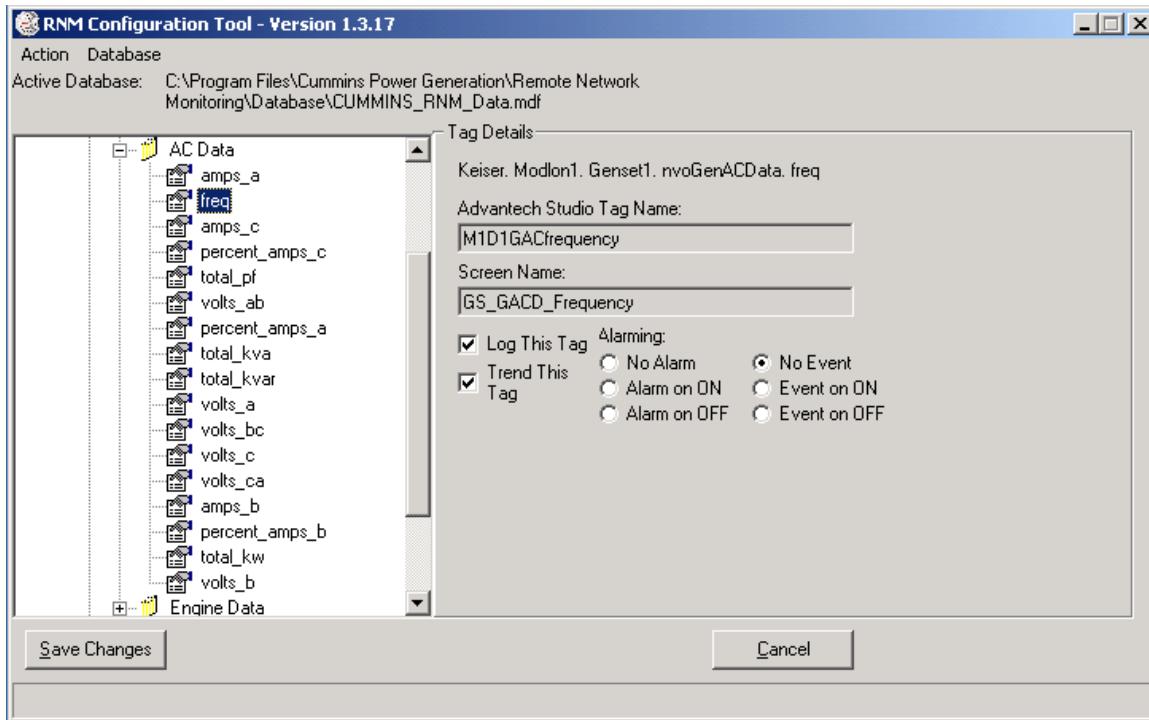

FIGURE 2-30. TAG DETAIL – RELAY/INPUT DESCRIPTIONS

DELETING SITES/MODLON GATEWAYS/DEVICES

If a site, ModLon gateway, or device item needs to be deleted, the *Delete* key on your keyboard can be pressed when the item to delete is selected. The dialog shown in Figure 2-31 is displayed prior to deleting the item selected.

NOTE: Deleting an item also deletes any items that are children of it. For example, deleting a ModLon gateway will delete all devices associated with it. Deleting a Site not only deletes all ModLon Gateways associated with the site, it also deletes all the devices associated with the deleted ModLon Gateways.

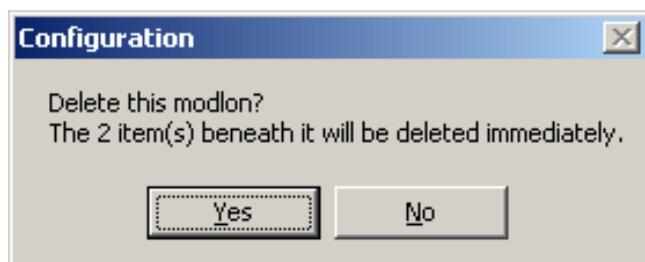

FIGURE 2-31. DELETE CONFIRMATION

Press *Yes* to delete the selected item or *No* to cancel the delete.

NOTE: Deleting an item is immediately reflected in the configuration database and is not “undoable.”

DOWNLOADING WEBLINK APPLICATIONS

To download a configured site application to a Web-Link, you need to execute the Advantech Web Studio 6.0 application from the icon that was placed on your desktop during the install.

FIGURE 2-32. ADVANTECH WEB STUDIO 6.0 ICON

If there is no Advantech Web Studio icon, the application can be launched from the start menu as shown in Figure 2-33.

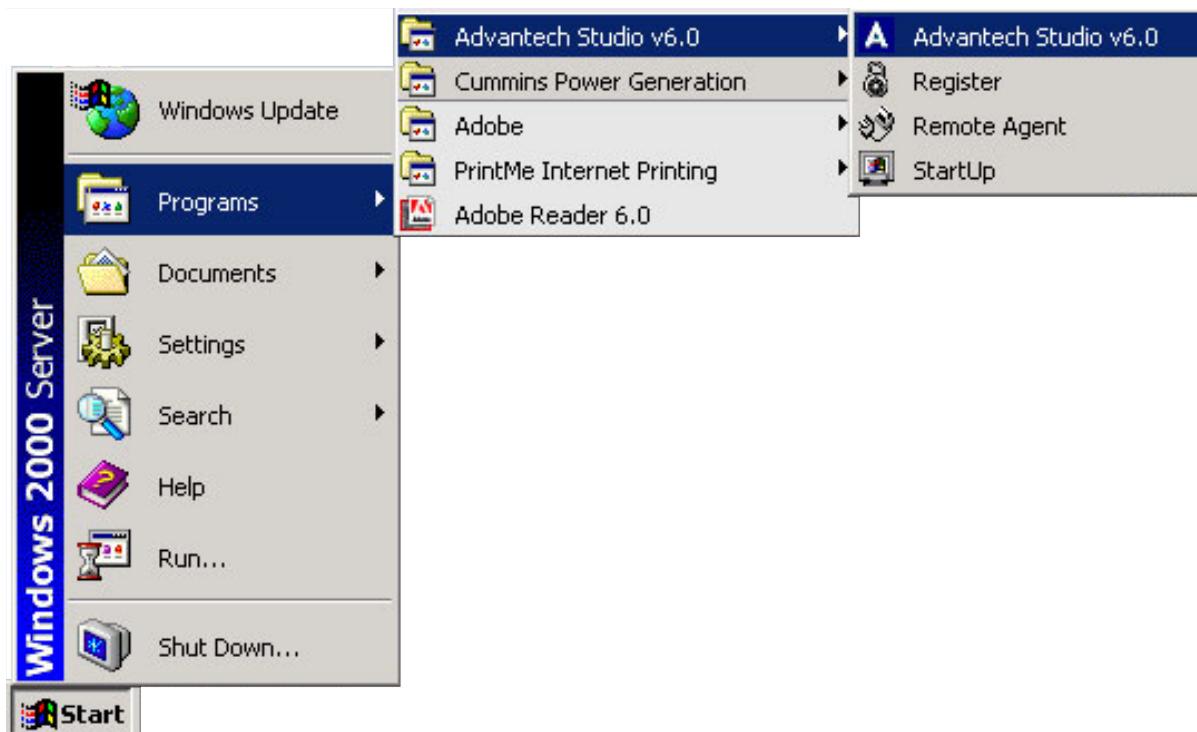

FIGURE 2-33. ADVANTECH STUDIO 6.0 START MENU

Once the Advantech Studio application is running, you can open up your application to deploy using the *File/Open Project* menu option and browsing to the directory created by the configuration tool (see Figure 2-34). The directory is typically located under c:\Program Files\RNMConfig.

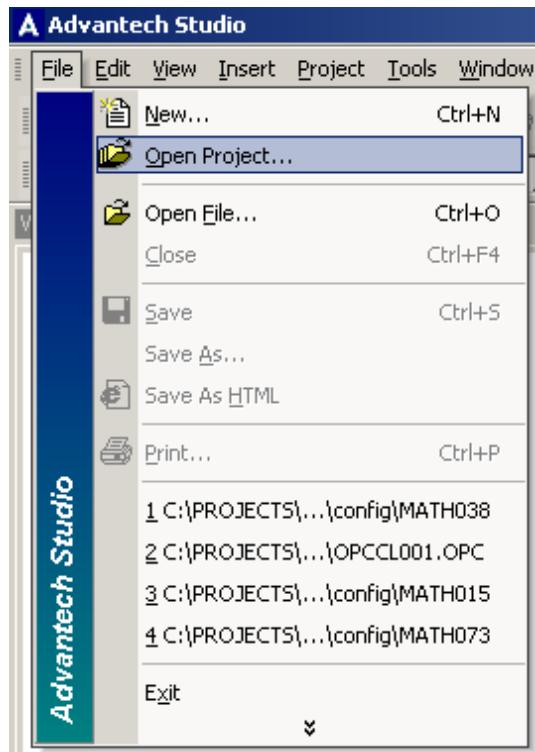

FIGURE 2-34. ADVANTECH STUDIO – OPEN PROJECT

Once the project is opened, it can be downloaded to an Ethernet or dial-up network connected to the WebLink. To do this, select the *Project / Execution Environment* menu option (see Figure 2-35).

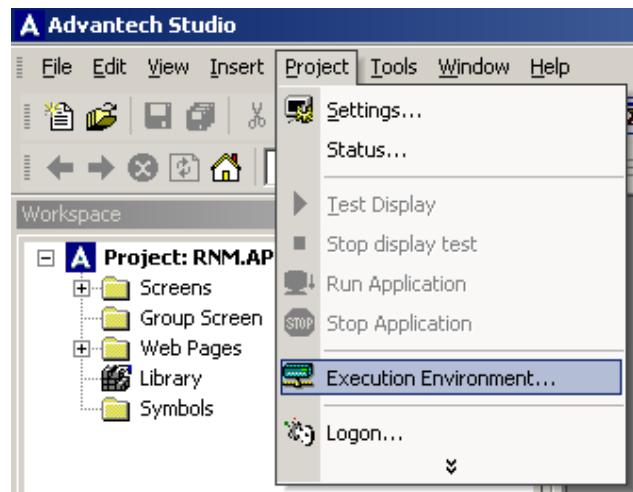

FIGURE 2-35. ADVANTECH STUDIO – EXECUTION ENVIRONMENT

The Execution Environment dialog is displayed (see Figure 2-36). To connect to the WebLink, select the *Network IP* radio button, check the value in the IP Address edit box, and click on the *Connect* button.

This should change the dialog status message to show the connection status (see Figure 2-37).

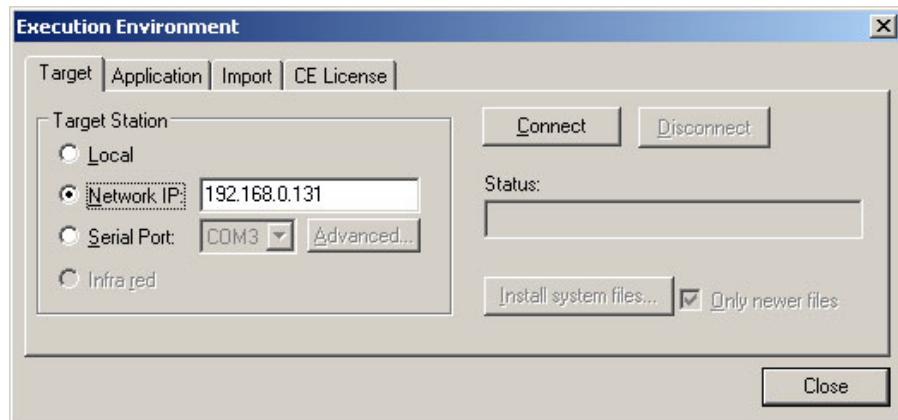

FIGURE 2-36. EXECUTION ENVIRONMENT DIALOG

To download the application to the WebLink, click the *Application* tab. This should change the dialog status message to show the connection status (see Figure 2-38).

The application must be stopped before sending the application to the target. Click on the the *Stop* button (see Figure 2-39).

The *Only newer files* check box can be left checked to speed the download with only updated files being downloaded. If it is unchecked, all files in the application will be downloaded, even if they are current on the WebLink. This could take considerably longer to download the files.

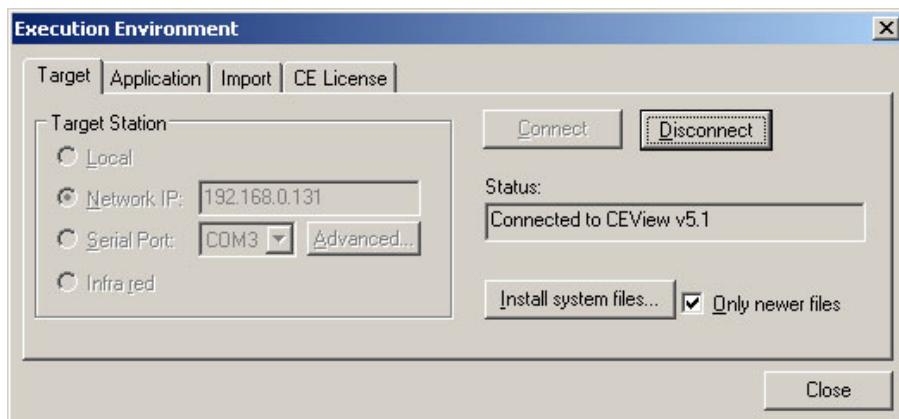

FIGURE 2-37. EXECUTION ENVIRONMENT DIALOG – CONNECTED

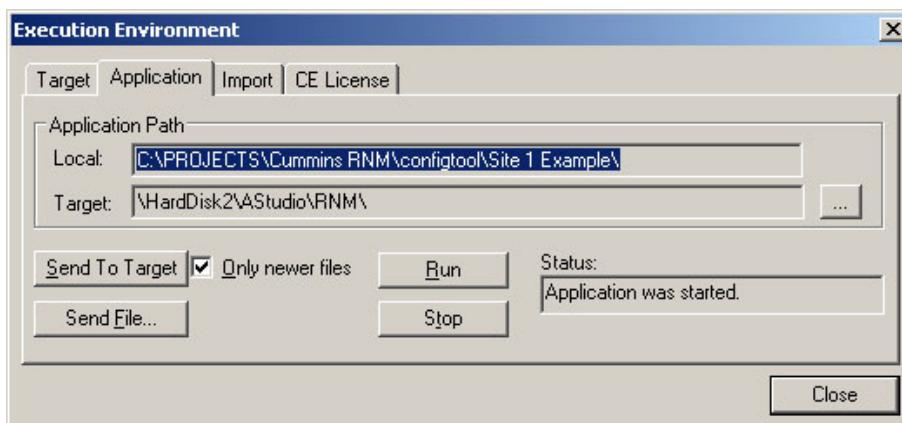

FIGURE 2-38. EXECUTION ENVIRONMENT DIALOG – APPLICATION TAB

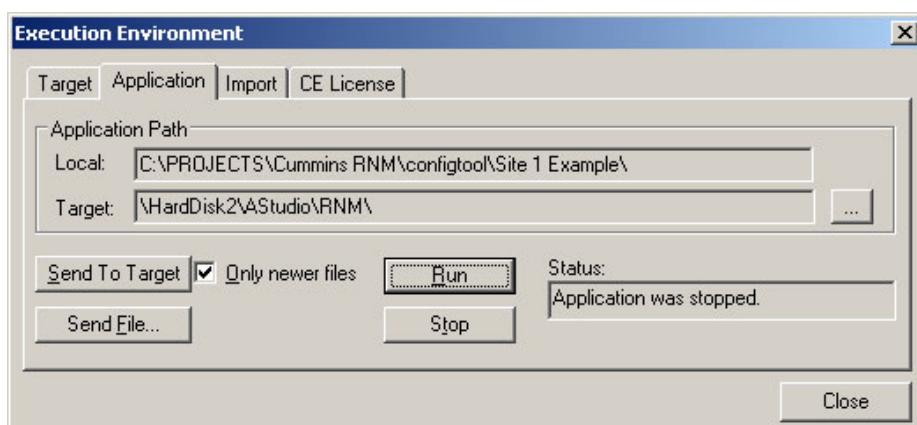

FIGURE 2-39. EXECUTION ENVIRONMENT DIALOG – STOPPED APPLICATION

The application can now be sent to the target Web-Link by selecting the *Send to Target* button. A series of dialogs, labeled *Send to Target* and *Sending Files to Target*, are then displayed showing the progress of the download (see Figures 2-40 and 2-41).

Once the download is complete, the status is updated to reflect that the *Application was updated with success* (see Figure 2-42).

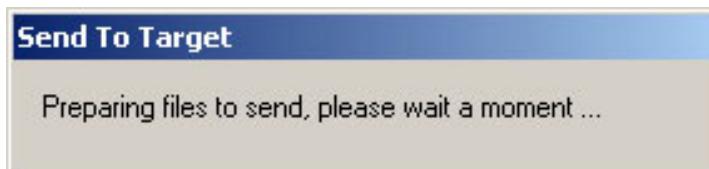

FIGURE 2-40. SEND TO TARGET DIALOG

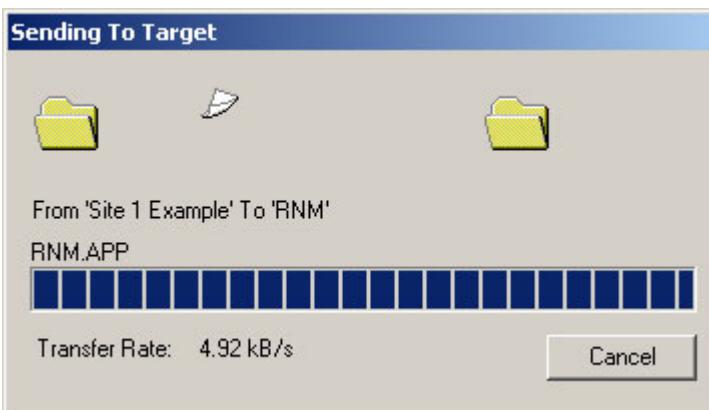

FIGURE 2-41. SENDING FILES TO TARGET DIALOG

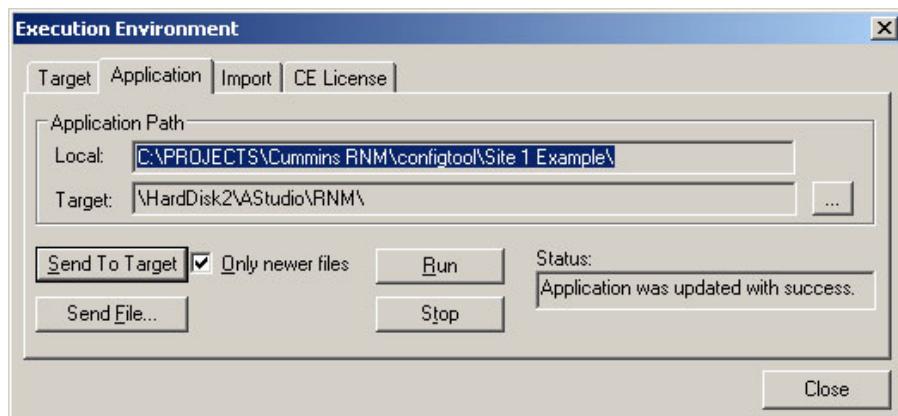

FIGURE 2-42. SENDING FILES TO TARGET

The remote application can now be started by using the *Run* button (see Figure 2-43).

When starting the remote application is successful, the *Status* reflects that the *Application was started* (see Figure 2-44). Click on the *Target* tab to disconnect from the remote WebLink.

Click on the *Disconnect* button to disconnect from the WebLink. Select the *Close* button to finish the download. The application is now downloaded and

running on the remote WebLink. This can be validated by running an Internet Explorer session with the URL address with the appropriate IP Address for the WebLink.

Example:

<http://192.168.0.131/studio/rnm/web/main.html>

The security login dialog is displayed (see Figure 2-45).

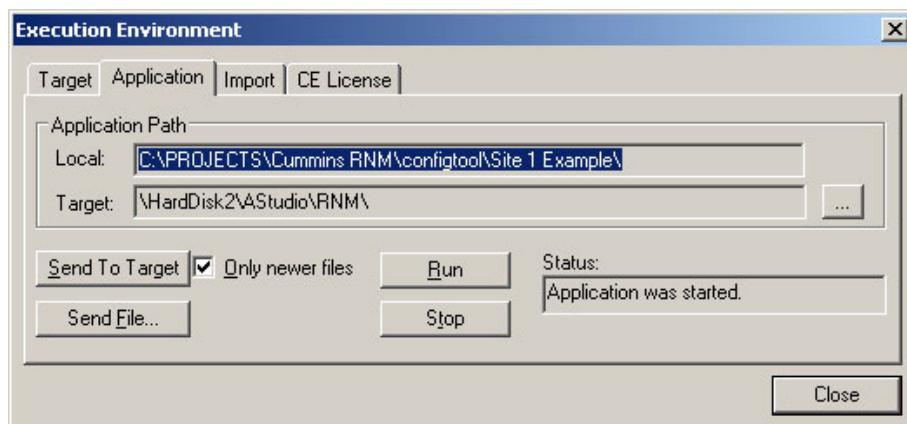

FIGURE 2-43. RUN APPLICATION

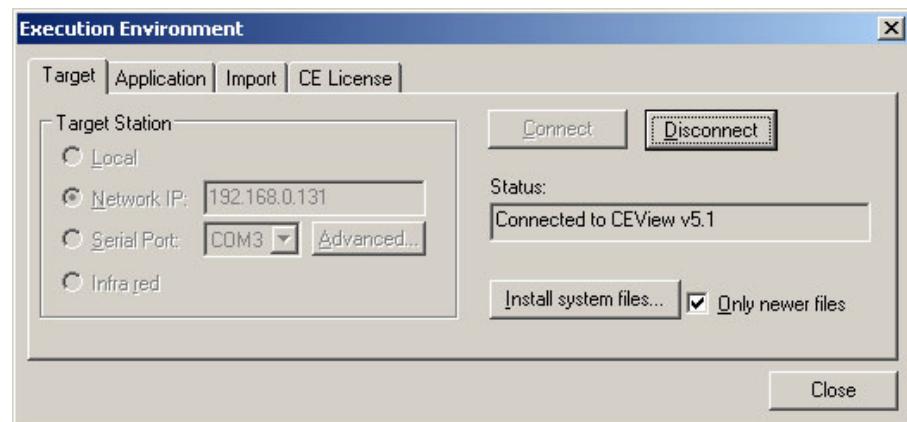

FIGURE 2-44. TARGET STATUS

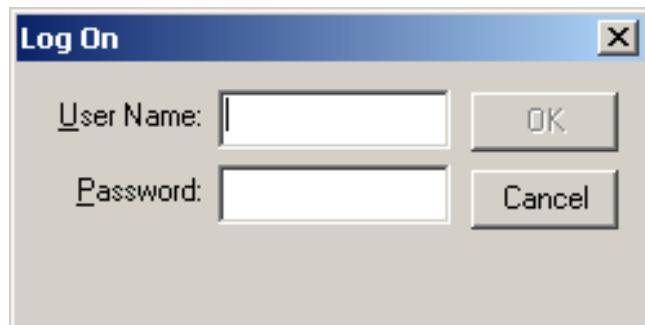

FIGURE 2-45. SECURITY LOGIN

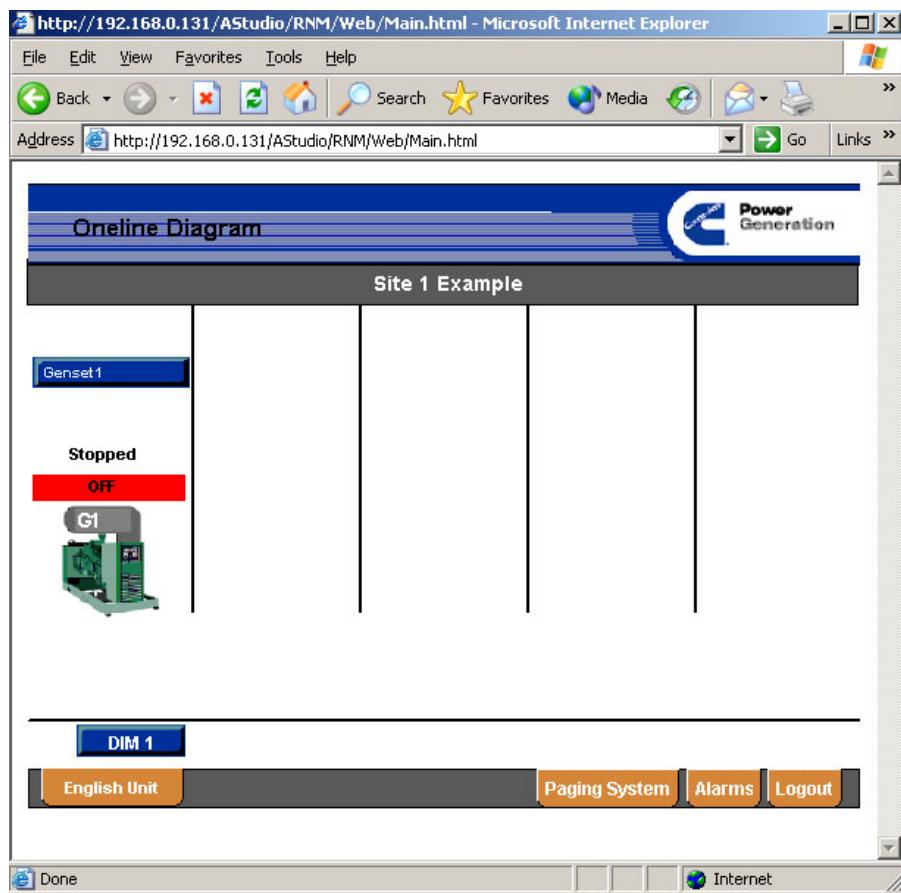

FIGURE 2-46. MAIN NAVIGATION SCREEN IN WEB BROWSER

After entering in a valid user name and password, the main navigation screen is displayed (see Figure 2-46).

NOTE: The valid list of logins can be modified prior to the download under the User and Security Group configuration options in Advantech Studio. For more information, see “Modifying Web-Link Login Security,” starting on page 2-25.

The application now is running properly on the WebLink. You may exit the Advantech Studio application by selecting the *File / Exit* menu option (see Figure 2-47).

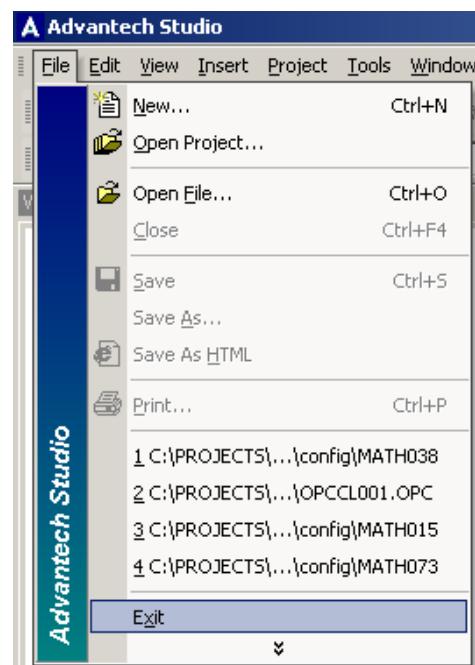

FIGURE 2-47. EXITING ADVANTECH STUDIO

MODIFYING WEBLINK LOGIN SECURITY

NOTE: A security level of at least 10 is required to operate the control functions within the application. This includes Generator Start/Stop/Reset Fault, ATS Test/Stop/Reset Fault, and DIM Relay forcing.

To create a custom set of security logins for the Web based application, Security Groups and Users can be configured in Advantech Studio prior to application download. This can be accomplished under the *Insert / User* or *Insert / Security Group* menu options of Advantech Studio (see Figure 2-48).

To create or modify a group account, select the *Insert / Security Group* menu option. The Group Account dialog is displayed (see Figure 2-49).

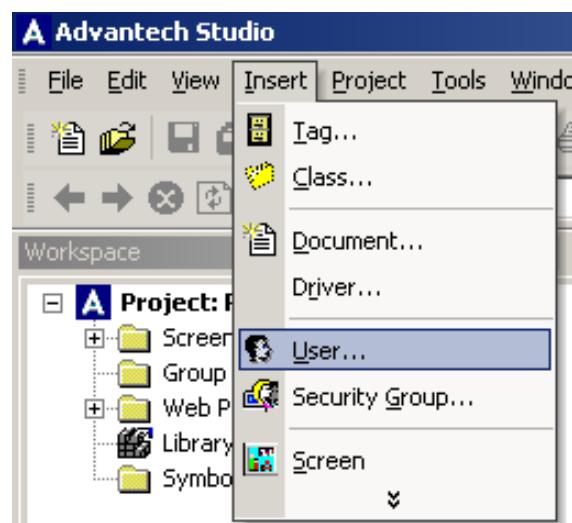

FIGURE 2-48. CONFIGURING ADVANTECH STUDIO SECURITY

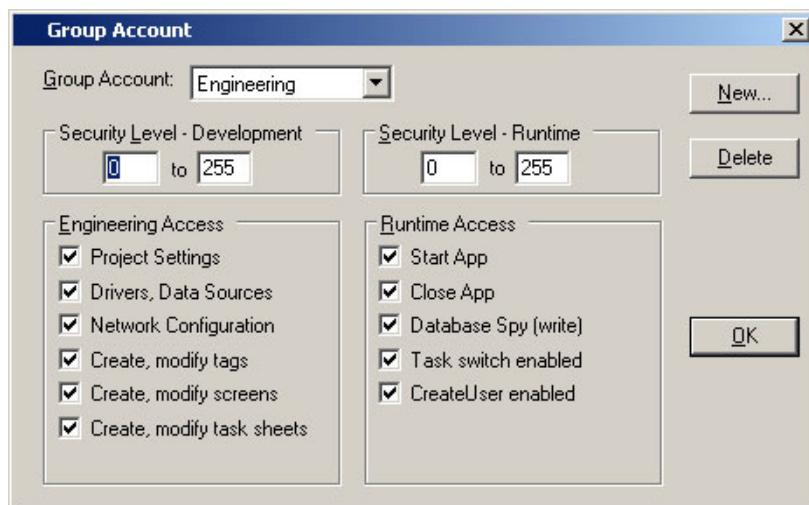

FIGURE 2-49. SECURITY – GROUP ACCOUNT DIALOG

To create a new group account, click on the *New* button and the dialog shown in Figure 2-50 is displayed. Enter a group name and click on *OK*.

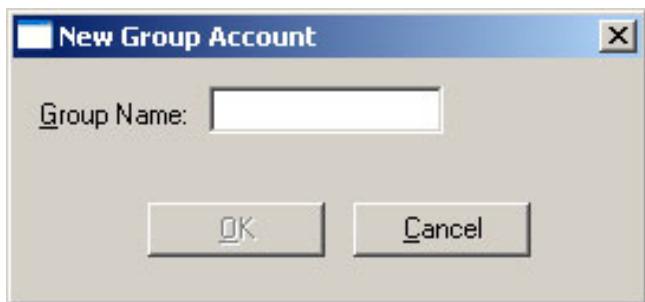

FIGURE 2-50. SECURITY – ENTER GROUP NAME

The new group account is now available in the *Group Account* pull-down list (see Figure 2-51). You

may edit the fields for Engineering and Runtime access as appropriate. Control functions within the application require security level of at least 100. To delete a group account, select it and click on the *Delete* button.

To create a new user account, select the *Insert / User* menu option (see Figure 2-48). The User Account dialog shown in Figure 2-52 is displayed.

Click on the *New* button to create a new user account. The New user Account dialog shown in Figure 2-53 is displayed.

Enter a new user name and click *OK* to continue. The user account is created without a password. To modify the password for a created account, select it in the list and click on the *Password* button of the New Account dialog (see Figure 2-52).

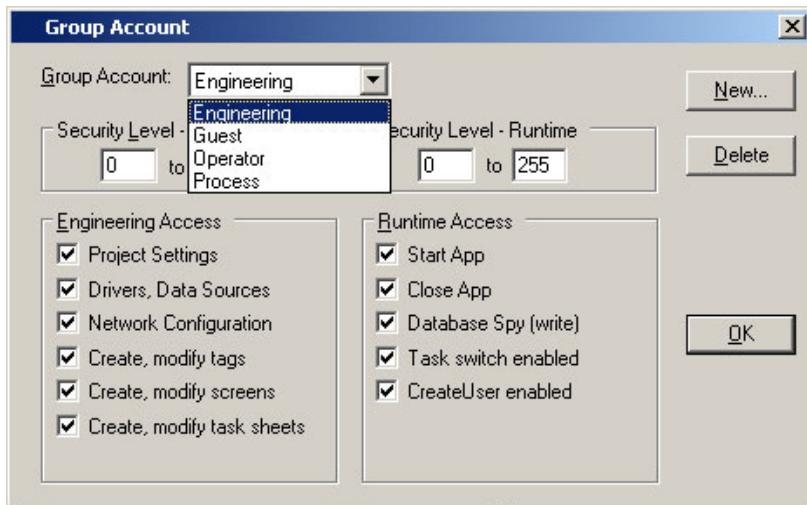

FIGURE 2-51. SECURITY – GROUP ACCOUNT SELECTION

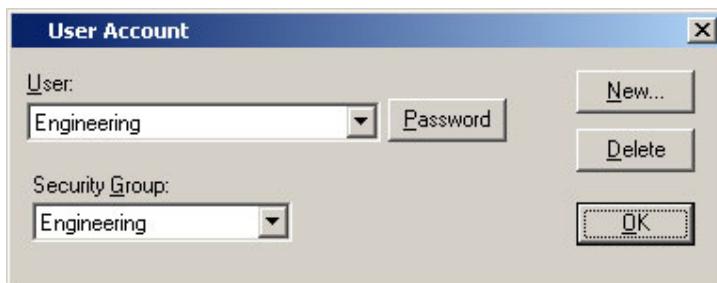

FIGURE 2-52. SECURITY – USER ACCOUNT DIALOG

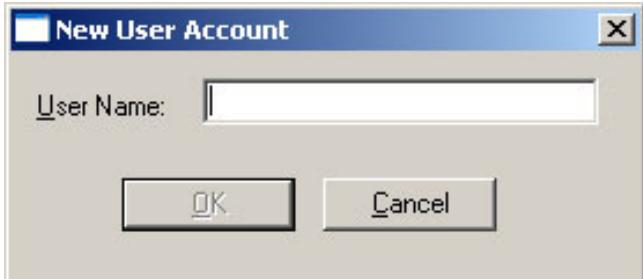

FIGURE 2-53. SECURITY – NEW USER ACCOUNT

Enter a new password, confirm it by re-entering it, and click on *OK* to complete the creation of a new user account (see Figure 2-54).

3. OPC Multiplexor

INTRODUCTION

The OLE for Process Control (OPC) provides a standard mechanism for communicating to smart field devices.

NOTE: Object Linking and Embedding (OLE) is a method for sharing information among Microsoft Windows-based applications.

The OPC Multiplexor is a series of application components that handle the following tasks in a remote networking architecture:

- On-demand OPC Client connectivity to remote WebLink sites
- Remote Access Service (RAS) connection initiation to remote WebLink sites
- OPC 2.0 Data Access (DA) compliant server
- Retrieval mechanism for storing and forwarding historical alarm and data files from remote WebLink sites

INSTALLATION

NOTE: The Configuration Tool must be installed prior to installing the OPC Multiplexor. Please see Section 2 in this manual for more information on installing the Configuration Tool.

The installation of the OPC Multiplexor is performed using the Setup.exe on the distribution CD. This application prompts the user for the option to install the Configuration Tool only or install both the configuration tool and the OPC Multiplexor.

The installation path is required to locate where the Advantech Studio software is installed. The default path is displayed. If you installed the software in a different location, use the **Browse** button to select a different path.

USER INTERFACE

The OPC Multiplexor dialog (see Figure 3-1) has three main user interface components:

- Upper Left – Tree view of sites/ModLon gateways/devices/tags
- Upper Right – Detail information on sites or individual tags
- Lower – Status log of connection/conversation events handled by the OPC Multiplexor

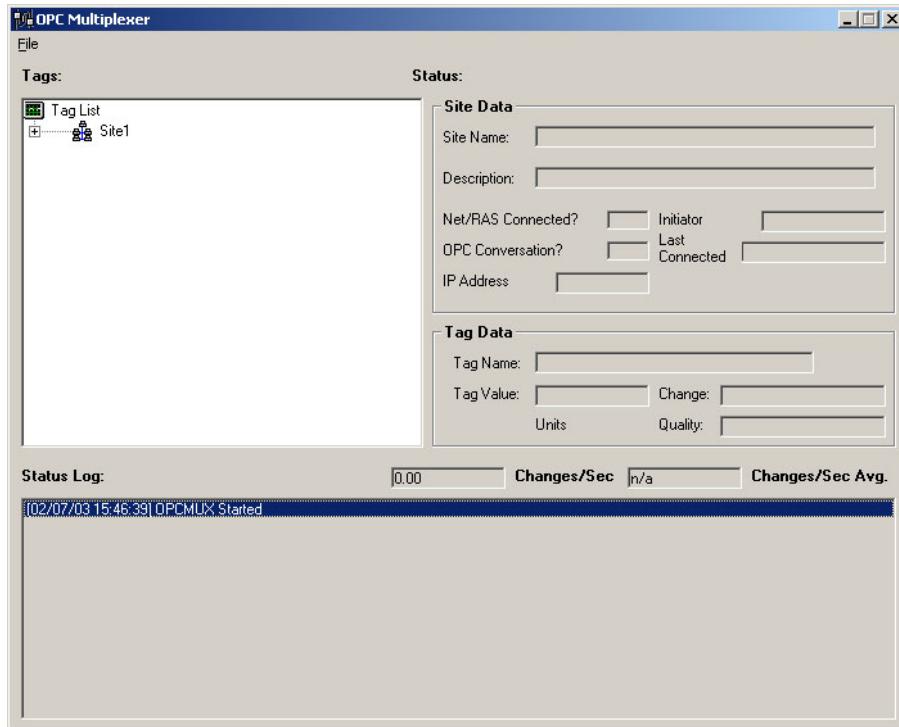

FIGURE 3-1. OPC MULTIPLEXOR MAIN DIALOG

When a site is selected, the details for the connection state of that site are displayed in the upper right pane (see Figure 3-2).

Detailed information about the tags associated to devices within a site can be browsed in the tree view to the upper left by clicking on the + and – icons to expand and collapse the branches (see Figure 3-3).

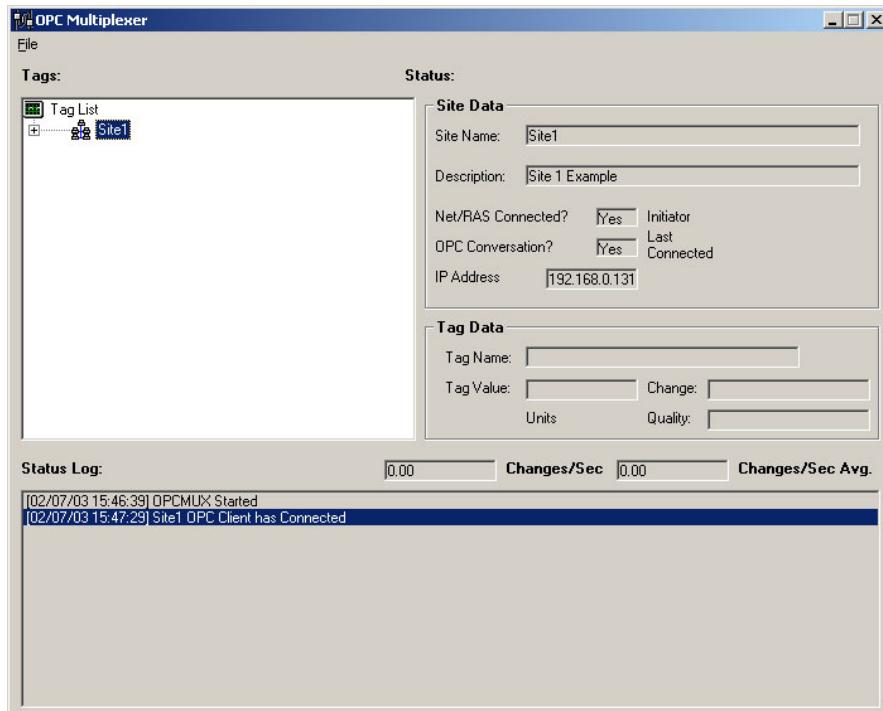

FIGURE 3-2. CONNECTED SITE INFORMATION

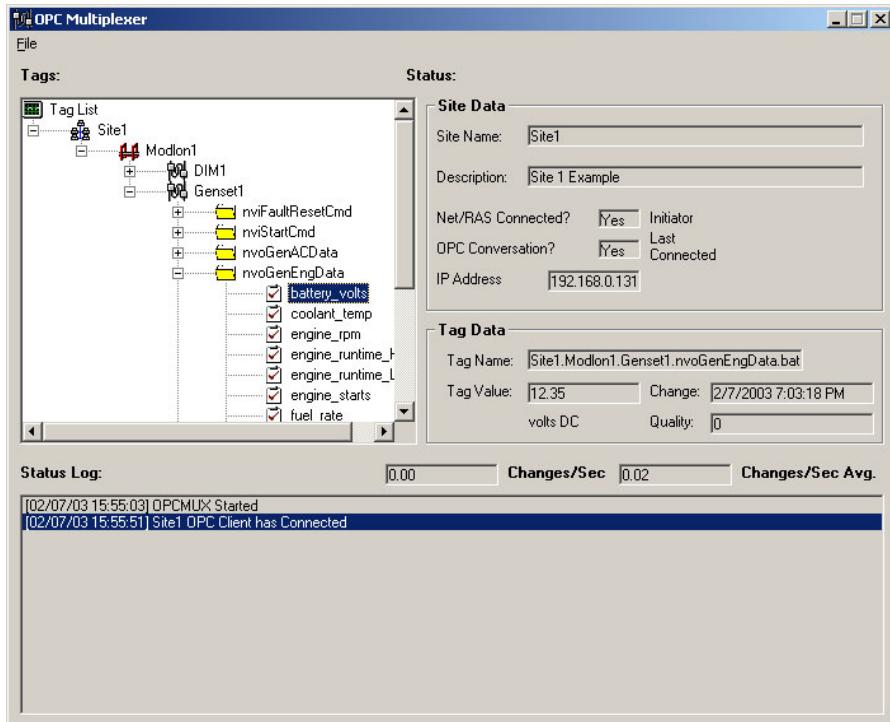

FIGURE 3-3. OPC MULTIPLEXOR – SITE CONNECTED

All Ethernet connected sites will auto-connect upon starting the OPC Multiplexor. The OPCMUX_Client applications running reflect each of the connected sites (see Figure 3-4).

If a connection to a site is lost, the OPC Multiplexor shows the disconnected status and automatically attempts to reconnect the site (see Figure 3-5).

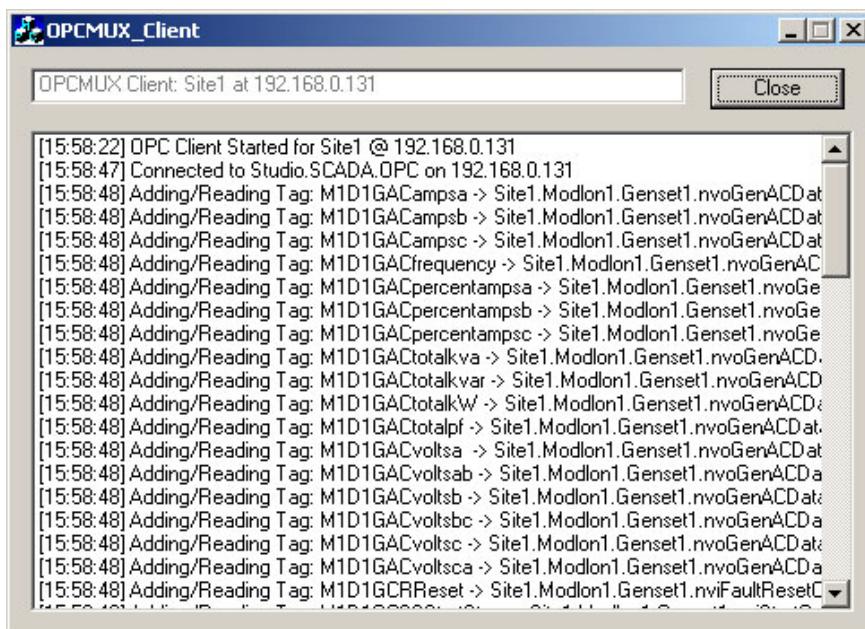

FIGURE 3-4. OPC MULTIPLEXOR – OPC CLIENT COMPONENT

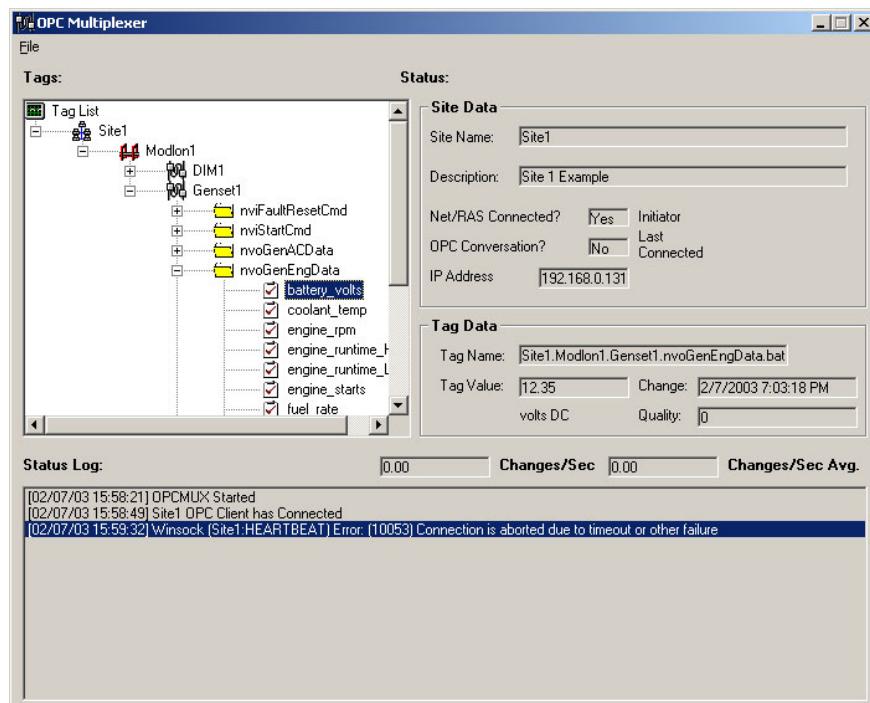

FIGURE 3-5. OPC MULTIPLEXOR – DISCONNECTED CLIENT

Once the site is reconnected, a new OPCMUX_Client session starts and the status is reflected in the

OPC Multiplexor Status Log and Tag Data sections (see Figure 3-6).

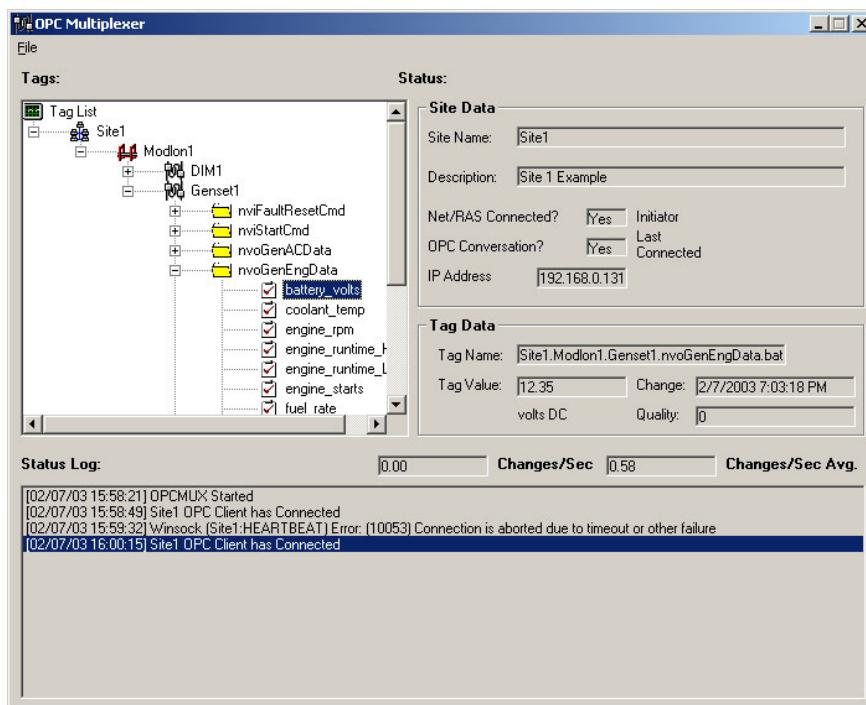

FIGURE 3-6. OPC MULTIPLEXOR – RECONNECTED CLIENT

OPC SERVER

The OPC Server component of the OPC Multiplexor is an OPC 2.0 DA compliant server. The data hosted is both the direct connected and dial-up site tags. The OPC Server class name is:

OPCMUX_Server

The server supports an unlimited number of sites. Each site contains a folder for the ModLon gateways configured for that site.

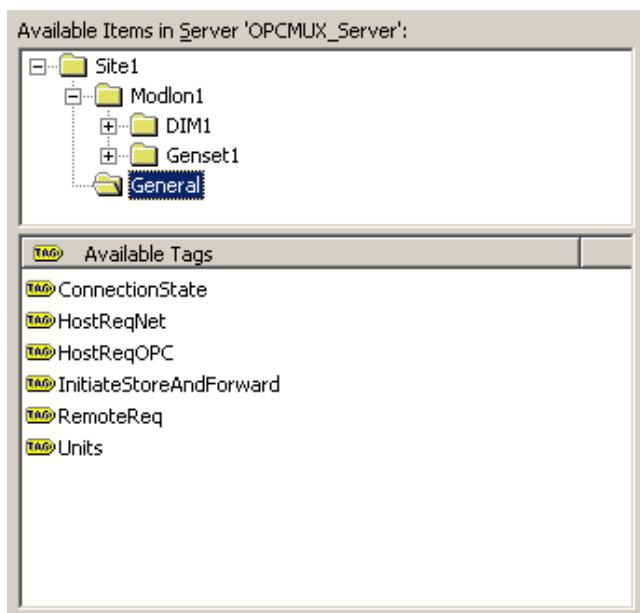

FIGURE 3-7. OPC SERVER GENERAL FOLDER

The General folder under the Site folder includes overall site tags (see Figure 3-7). Table 3-1 describes the purpose of these general tags.

The individual folders under a device item in the ModLon gateway folder follow the same convention as those shown by the OPC Multiplexor in its user interface (see Figure 3-8).

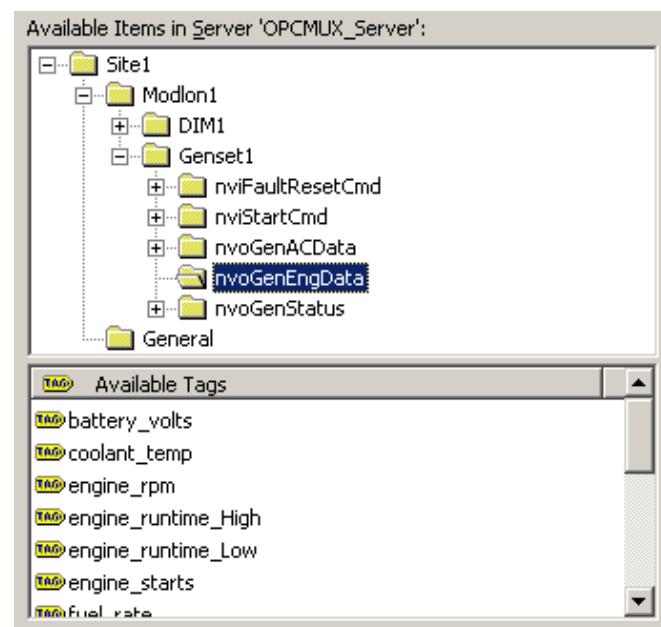

FIGURE 3-8. OPC SERVER DEVICE FOLDERS

TABLE 3-1. OPC SERVER GENERAL TAGS

Tag	Type	Description
ConnectionString	String	Holds the current connection state of the site
HostReqNet	String	A value being written to this field triggers the OPC Multiplexor to check or establish a network connection to the site
HostReqOPC	String	A value being written to this field triggers the OPC Multiplexor to check or establish a network connection to the site and then create an OPC conversation
InitiateStoreAndForward	String	A value being written to this field triggers the OPC Multiplexor to start the ATE Logger processing for the site
RemoteReq	String	A value being written to this field triggers the OPC Multiplexor to check or establish a network connection to the site and start the ATE Logger processing for the site
Units	Integer	Integer representation of the units of measure current in use at the site. 1 = Metric 0 = English

HISTORICAL DATA/ALARM STORAGE AND FORWARDING

The OPC Multiplexor can move historical data and alarm files from the remote devices into the local configuration database for permanent storage. This feature is activated by configuring a site to Store and Forward files at a specified interval. The Site Information dialog within the configuration tools includes the options to specify whether or not the files will be stored and/or forwarded (see Figure 3-9).

Selecting the **Disable Auto Alarm Forward** check box stops the remote WebLink from attempting to

connect to the host on a fault condition and forwarding the current alarm logs. This feature should be disabled for Ethernet connected sites.

Selecting the **Disable Site Historical Logging** check box stops the remote WebLink from creating historical data log files.

The **Store and Forward** day check boxes and **Time** entry field are used to specify the frequency and time to forward the logged files.

This historical data is stored in the configuration database tables listed in Table 3-2.

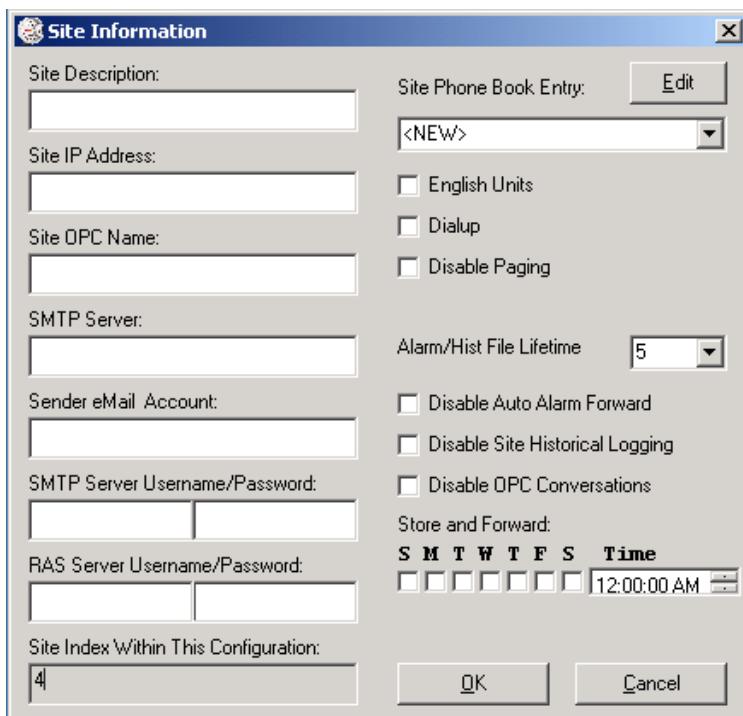

FIGURE 3-9. SITE CONFIGURATION DIALOG

TABLE 3-2. CONFIGURATION DATABASE TABLES

Appendix A. ModLon Gateway Register Maps

This appendix includes information on register mapping of the following modules to a ModLon Gateway used in FT-10 networks.

- Single PowerCommand Genset
- Paralleling PowerCommand Genset
- Automatic Transfer Switch (ATS) – Simple
- ATS – Detailed
- Digital I/O Module (DIM)

* Fault codes are listed in the genset Operator's/Service Manuals.

Data = Multiplier x (Register + Offset)

NOTES:

- For the Data Points Engine Runtime, the Total kwh and Total Fuel for the two registers designated as high and low are put together as an unsigned double integer. This is accomplished by multiplying the value in the high register by 65536 and adding it to the value in the low register. Most software packages automatically perform this calculation if the value is simply identified as an unsigned double integer.
- Value not supported in the 3200 controller.
- Value not supported in the 3100 controller.
- Value not supported.
- With 3100 and 2100 controllers, the units are hours. With the 3200 controller, the units are seconds. The multiplier is always 0.1
For all 3100 controllers, the values given are based on using EEPROM firmware, version 2.0 or greater. The values for Engine Runtime and Total kwh are not available on QST-30 gensets.

Data = Multiplr x (Reg + Offset)

NOTES:

- For the Data Points Engine Runtime, the Total kwh and Total Fuel for the two registers designated as high and low are put together as an unsigned double integer. This is accomplished by multiplying the value in the high register by 65536 and adding it to the value in the low register. Most software packages automatically perform this calculation if the value is simply identified as an unsigned double integer.
- Value not supported in the 3200 controller.
- Value not supported in the 3100 controller.
- Value not supported.
- With 3100 and 2100 controllers, the units are hours. With the 3200 controller, the units are seconds. The multiplier is always 0.1. For all 3100 controllers, the values given are based on using EEPROM firmware, version 2.0 or greater. The values for Engine Runtime and Total kwh are not available on QST-30 gensets.

												Gal

NOTES:

- For the Data Points Engine Runtime, the Total kwh and Total Fuel for the two registers designated as high and low are put together as an unsigned double integer. This is accomplished by multiplying the value in the high register by 65536 and adding it to the value in the low register. Most software packages automatically perform this calculation if the value is simply identified as an unsigned double integer.
 - Value not supported in the 3200 controller.
 - Value not supported in the 3100 controller.
 - Value not supported.
 - With 3100 and 2100 controllers, the units are hours. With the 3200 controller, the units are seconds. The multiplier is always 0.1
- For all 3100 controllers, the values given are based on using EEPROM firmware, version 2.0 or greater. The values for Engine Runtime and Total kwh are not available on QST-30 gensets.
